HPV16-PsV neutralization in serum, cervical and oral samples across study visits.

Representative fluorescence microscopy images of PsV-infected 293TT cells following incubation with serum, cervical and oral samples collected from the same participant at different study visits (before vaccination – visit 1, after one dose – visit 2, after two doses – visit 3, and after three doses – visit 4). EGFP-expressing cells (green) indicate PsV infection, while Hoechst (red) stains nuclei. Scale bars: 100 μ m.
