

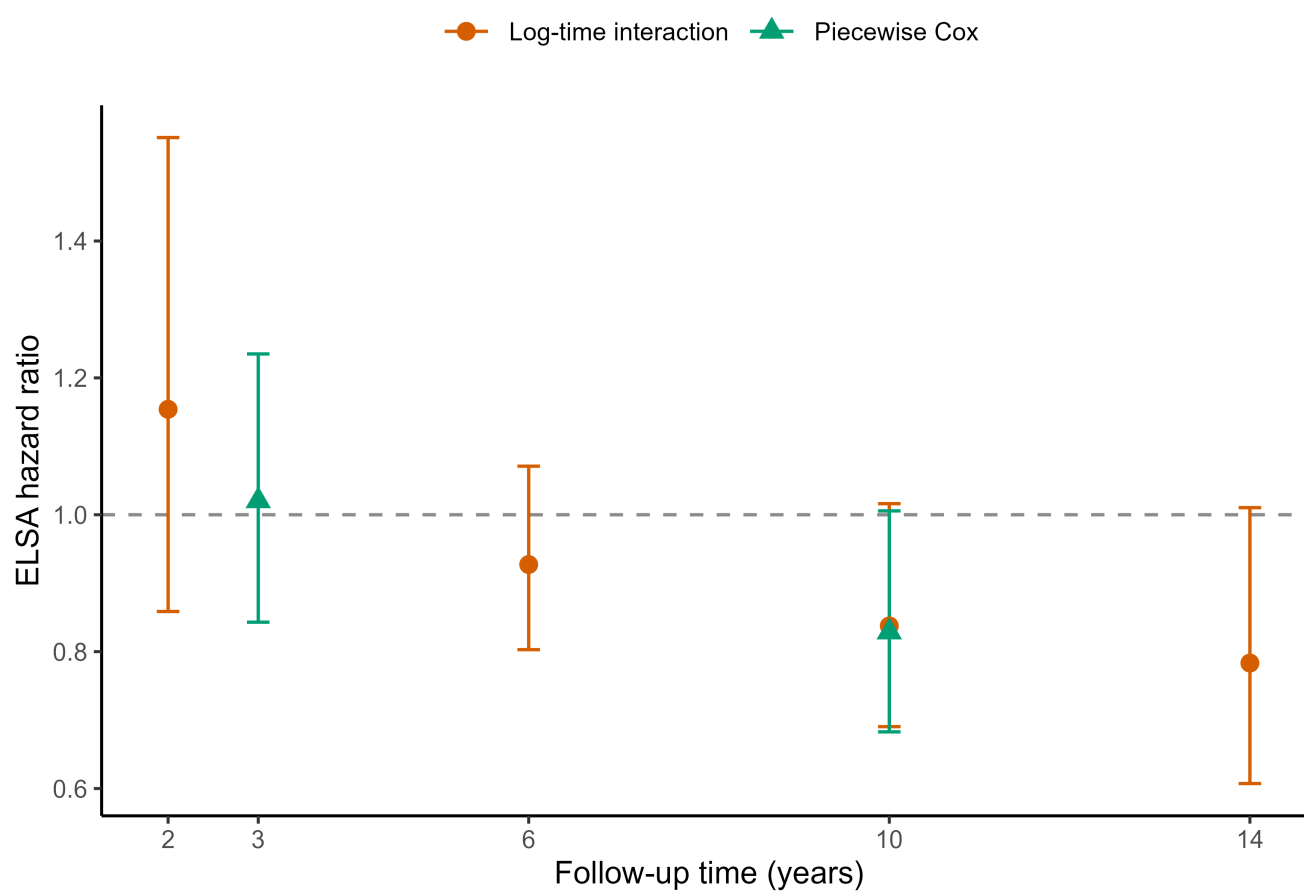

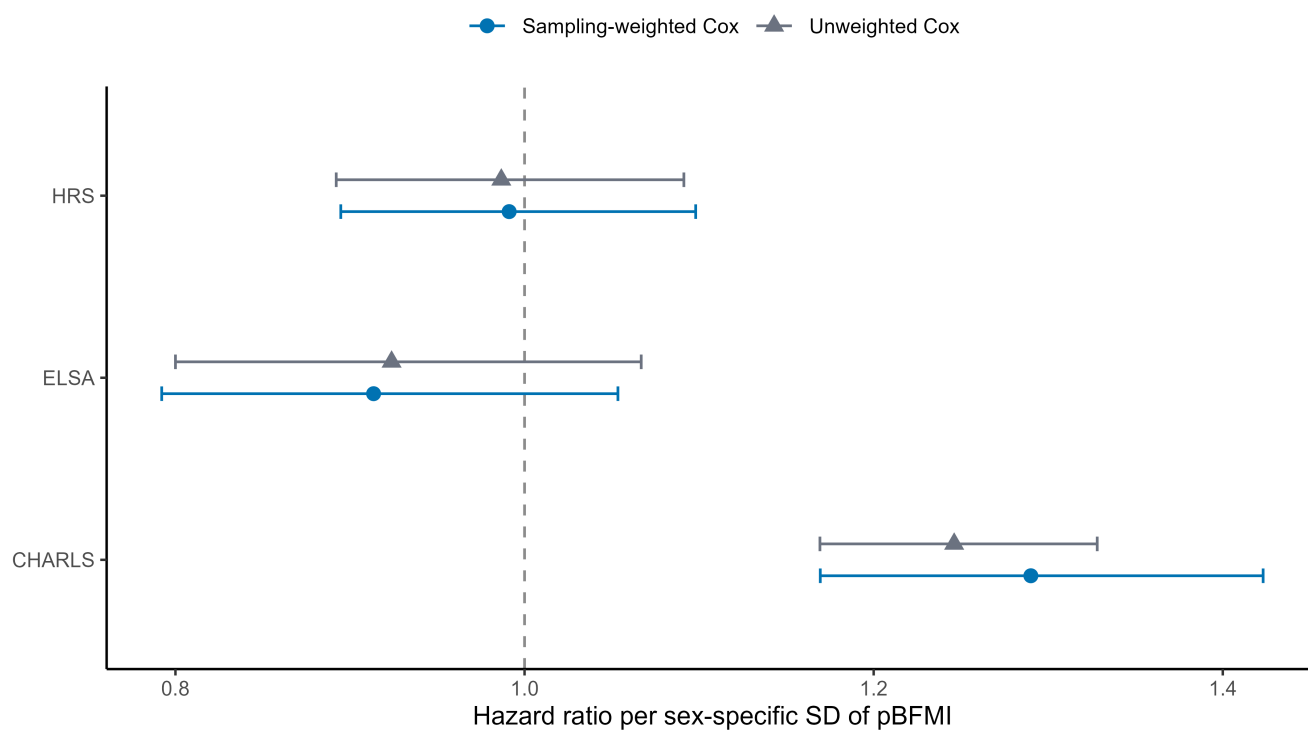

Figure S1. Exploratory time-dependent pBFMI association in ELSA

Analyses were restricted to participants aged 65 years or older. Hazard ratios are shown at selected follow-up times for the log-time interaction model and for the exploratory piecewise Cox model. Error bars denote 95% confidence intervals. The 6-year cut point was diagnostic and not protocol specified.

Figure S2. Sampling-weighted Model 2 Cox estimates

Analyses were restricted to participants aged 65 years or older. Cohort-specific hazard ratios are reported per sex-specific standard deviation higher predicted fat mass index. Models used available individual sampling weights and robust standard errors. Error bars denote 95% confidence intervals.
