

Supplementary Fig. S1: SDOS associates with ribosomes in BC cells

A) Representative western blot of isolated ribosomes after 4-hour treatment with etoposide (40 μ M) and respective untreated control. After 4-hour treatment, SDOS presence in the ribosomal pellet is reduced. Vinculin was used as a marker of ribosome-free cytosolic compartment, EFTU and ATP6 for mitochondria, while ribosomal protein S6, and ribosomal protein L19 were used as ribosomal markers to confirm enrichment of ribosomes in the pellet.
