Reporting Summary

Nature Portfolio wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Portfolio policies, see our Editorial Policies and the Editorial Policy Checklist.

Statistics

For all statistical analyses, confirm that the following items are present in the figure legend, table legend, main text, or Methods section.

n/a	Confirmed
☐	☒ The exact sample size (*n*) for each experimental group/condition, given as a discrete number and unit of measurement
☐	☒ A statement on whether measurements were taken from distinct samples or whether the same sample was measured repeatedly
☐	☒ The statistical test(s) used AND whether they are one- or two-sided *Only common tests should be described solely by name; describe more complex techniques in the Methods section.*
☐	☒ A description of all covariates tested
☐	☒ A description of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons
☐	☒ A full description of the statistical parameters including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) AND variation (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)
☐	☒ For null hypothesis testing, the test statistic (e.g. *F*, *t*, *r*) with confidence intervals, effect sizes, degrees of freedom and *P* value noted *Give P values as exact values whenever suitable.*
☒	☐ For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings
☐	☒ For hierarchical and complex designs, identification of the appropriate level for tests and full reporting of outcomes
☐	☒ Estimates of effect sizes (e.g. Cohen's *d*, Pearson's *r*), indicating how they were calculated

Our web collection on statistics for biologists contains articles on many of the points above.

Software and code

Policy information about availability of computer code

Data collection	Web of Science Core Collection (Topic searches; 5 April 2026); Google NotebookLM (Gemini model family) for retrieval-augmented extraction; VOSviewer 1.6.20 for bibliometric analysis.
Data analysis	R 4.5.1 (metafor 5.0-1, orchaRd 2.2.0, clubSandwich 0.7.0, emmeans 2.0.3, tidyverse) and Python 3.11.7 (pandas, NumPy, scikit-learn). Custom analysis scripts and reproducibility documentation are available in the anonymized Figshare deposit.

For manuscripts utilizing custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors and reviewers. We strongly encourage code deposition in a community repository (e.g. GitHub). See the Nature Portfolio guidelines for submitting code & software for further information.

Data

Policy information about availability of data

All manuscripts must include a data availability statement. This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A description of any restrictions on data availability
- For clinical datasets or third party data, please ensure that the statement adheres to our policy

The Quantitative Global Mangrove Biodiversity Risk Database (QGMBRD), including effect-size data, study-level metadata, provenance information and analysis-

ready inputs, is available to reviewers through an anonymized private Figshare link: https://figshare.com/s/a41d361d842d56e6ab60. The accompanying analysis code and reproducibility documentation are available through the same link. The deposit will be made public upon publication.

Research involving human participants, their data, or biological material

Policy information about studies with human participants or human data. See also policy information about sex, gender (identity/presentation), and sexual orientation and race, ethnicity and racism.

Reporting on sex and gender	*Use the terms sex (biological attribute) and gender (shaped by social and cultural circumstances) carefully in order to avoid confusing both terms. Indicate if findings apply to only one sex or gender; describe whether sex and gender were considered in study design; whether sex and/or gender was determined based on self-reporting or assigned and methods used.* *Provide in the source data disaggregated sex and gender data, where this information has been collected, and if consent has been obtained for sharing of individual-level data; provide overall numbers in this Reporting Summary. Please state if this information has not been collected.* *Report sex- and gender-based analyses where performed, justify reasons for lack of sex- and gender-based analysis.*
Reporting on race, ethnicity, or other socially relevant groupings	*Please specify the socially constructed or socially relevant categorization variable(s) used in your manuscript and explain why they were used. Please note that such variables should not be used as proxies for other socially constructed/relevant variables (for example, race or ethnicity should not be used as a proxy for socioeconomic status).* *Provide clear definitions of the relevant terms used, how they were provided (by the participants/respondents, the researchers, or third parties), and the method(s) used to classify people into the different categories (e.g. self-report, census or administrative data, social media data, etc.)* *Please provide details about how you controlled for confounding variables in your analyses.*
Population characteristics	*Describe the covariate-relevant population characteristics of the human research participants (e.g. age, genotypic information, past and current diagnosis and treatment categories). If you filled out the behavioural & social sciences study design questions and have nothing to add here, write "See above."*
Recruitment	*Describe how participants were recruited. Outline any potential self-selection bias or other biases that may be present and how these are likely to impact results.*
Ethics oversight	*Identify the organization(s) that approved the study protocol.*

Note that full information on the approval of the study protocol must also be provided in the manuscript.

Field-specific reporting

Please select the one below that is the best fit for your research. If you are not sure, read the appropriate sections before making your selection.

☐ Life sciences ☐ Behavioural & social sciences ☒ Ecological, evolutionary & environmental sciences

Ecological, evolutionary & environmental sciences study design

All studies must disclose on these points even when the disclosure is negative.

Study description	Systematic quantitative evidence synthesis of published mangrove studies, combining bibliometric analysis and three-level multilevel meta-analysis. Four anthropogenic driver categories, four biological receptor groups and ecological scales were evaluated. No new experiments were conducted.
Research sample	Published original research on mangrove ecosystem responses to anthropogenic pressures (2001–2025). The final spatial synthesis included 343 effect sizes from 196 articles across 34 biogeographic nodes (IWP: 238 effects, 24 nodes; AEP: 105 effects). The rigorous subset comprised 151 effect sizes from 92 articles across 28 nodes.
Sampling strategy	Systematic Web of Science Core Collection searches using seven driver-specific queries, followed by PRISMA 2020 screening and predefined eligibility and quality-control criteria. No prospective sample-size calculation was performed; all eligible published observations were considered.
Data collection	Records were retrieved from Web of Science Core Collection and screened using PRISMA 2020. Data were extracted with Google NotebookLM (Gemini family) using driver-specific prompts and source-linked retrieval. Locations were geocoded against gazetteers and manually adjudicated where necessary.
Timing and spatial scale	Web of Science was searched on 5 April 2026 for studies published during 2001–2025. The synthesis covered global mangrove ecosystems across 34 biogeographic nodes in the Indo-West Pacific and Atlantic-East Pacific regions.
Data exclusions	PRISMA screening reduced 10,071 records to 8,215 after document-type/year filtering and 6,744 unique articles after duplicate and unavailable/retracted-record removal. Of 393 paired observations, 46 failed quality control (42 non-positive means, 3 context-dependent directions, 1 unverifiable control), and 1 non-mangrove record was removed. Three further records were excluded from spatial modelling (2 mesocosm records without coordinates; 1 ecosystem-level receptor), yielding 343 effect sizes.

Reproducibility	All statistical analyses were re-run using the shared data and code. Robustness was assessed by comparing the full dataset (343 effect sizes) with a rigorous subset containing 151 effect sizes with measured sampling variances.
Randomization	*Describe how samples/organisms/participants were allocated into groups. If allocation was not random, describe how covariates were controlled. If this is not relevant to your study, explain why.*
Blinding	*Describe the extent of blinding used during data acquisition and analysis. If blinding was not possible, describe why OR explain why blinding was not relevant to your study.*

Did the study involve field work? ☐ Yes ☒ No

Reporting for specific materials, systems and methods

We require information from authors about some types of materials, experimental systems and methods used in many studies. Here, indicate whether each material, system or method listed is relevant to your study. If you are not sure if a list item applies to your research, read the appropriate section before selecting a response.

Materials & experimental systems

n/a	Involved in the study
☒	☐ Antibodies
☒	☐ Eukaryotic cell lines
☒	☐ Palaeontology and archaeology
☒	☐ Animals and other organisms
☒	☐ Clinical data
☒	☐ Dual use research of concern
☒	☐ Plants

Methods

n/a	Involved in the study
☒	☐ ChIP-seq
☒	☐ Flow cytometry
☒	☐ MRI-based neuroimaging

Plants

Seed stocks	*Report on the source of all seed stocks or other plant material used. If applicable, state the seed stock centre and catalogue number. If plant specimens were collected from the field, describe the collection location, date and sampling procedures.*
Novel plant genotypes	*Describe the methods by which all novel plant genotypes were produced. This includes those generated by transgenic approaches, gene editing, chemical/radiation-based mutagenesis and hybridization. For transgenic lines, describe the transformation method, the number of independent lines analyzed and the generation upon which experiments were performed. For gene-edited lines, describe the editor used, the endogenous sequence targeted for editing, the targeting guide RNA sequence (if applicable) and how the editor was applied.*
Authentication	*Describe any authentication procedures for each seed stock used or novel genotype generated. Describe any experiments used to assess the effect of a mutation and, where applicable, how potential secondary effects (e.g. second site T-DNA insertions, mosiacism, off-target gene editing) were examined.*
