Additional file 2. SWiM reporting checklist

The nine item numbers follow the SWiM reporting guideline. Short labels are paraphrased; limitations are reported rather than marked as completed procedures.

Item	Topic	Location or status
1	Study grouping	Methods — Grouping; outcome families and treatment categories kept separate.
2	Metrics and transformations	Methods — Synthesis method; source HR/RR, calculated individual-study OR, and eGFR quantities labelled separately.
3	Synthesis approach	Methods — Synthesis method; structured side-by-side interpretation without a clinical pooled estimate.
4	Prioritization	Methods — Prioritization; final renal reports and prespecified renal endpoints emphasized, with inconclusive results retained.
5	Heterogeneity	Methods and Discussion; clinical differences described, no meta-regression or subgroup meta-analysis.
6	Certainty	Methods — Appraisal of risk of bias and certainty; Additional file 11. GRADE by comparison and outcome for the principal comparisons; specific limitations recorded for the remaining estimates.
7	Presentation	Tables 2–3; Figures 2–4; source-level estimates and units retained.
8	Synthesis findings	Results organized by outcome family; no cross-drug ranking or significance vote counting.
9	Limitations	Discussion; post hoc eligibility amendment, reports of unresolved adult eligibility, three reports not retrieved and heterogeneous outcomes. Additional file 10 distinguishes completed result-level judgements, source-checked additional assessments and unassessed results.
