

Reporting Summary

Nature Research wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Research policies, see [Authors & Referees](#) and the [Editorial Policy Checklist](#).

Statistical parameters

When statistical analyses are reported, confirm that the following items are present in the relevant location (e.g. figure legend, table legend, main text, or Methods section).

n/a Confirmed

- ☐ ☒ The exact sample size (n) for each experimental group/condition, given as a discrete number and unit of measurement
- ☐ ☒ An indication of whether measurements were taken from distinct samples or whether the same sample was measured repeatedly
- ☐ ☒ The statistical test(s) used AND whether they are one- or two-sided
Only common tests should be described solely by name; describe more complex techniques in the Methods section.
- ☒ ☐ A description of all covariates tested
- ☐ ☒ A description of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons
- ☒ ☐ A full description of the statistics including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) AND variation (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)
- ☒ ☐ For null hypothesis testing, the test statistic (e.g. F , t , r) with confidence intervals, effect sizes, degrees of freedom and P value noted
Give P values as exact values whenever suitable.
- ☒ ☐ For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings
- ☒ ☐ For hierarchical and complex designs, identification of the appropriate level for tests and full reporting of outcomes
- ☒ ☐ Estimates of effect sizes (e.g. Cohen's d , Pearson's r), indicating how they were calculated
- ☐ ☒ Clearly defined error bars
State explicitly what error bars represent (e.g. SD, SE, CI)

Our web collection on [statistics for biologists](#) may be useful.

Software and code

Policy information about [availability of computer code](#)

Data collection	MacroModel 11.7, Gaussian 09, Coot, Topsis (Bruker), Data explorer v3.4 (Bruker), Lab Solutions (Shimadzu), Unicorn 7 (GE)
Data analysis	Microsoft Excel, Pymol (Schroedinger), MiBIG, Muscle, Schrödinger Release 2019-1, Caver, PISA, Dali, XDS, Aimless, CCP4, Phenix, Phaser, ProteinProspector v5.22.1, QualBrowser (XCalibur 3.0.63, Thermo Scientific)

For manuscripts utilizing custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors/reviewers upon request. We strongly encourage code deposition in a community repository (e.g. GitHub). See the Nature Research [guidelines for submitting code & software](#) for further information.

Data

Policy information about [availability of data](#)

All manuscripts must include a [data availability statement](#). This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A list of figures that have associated raw data
- A description of any restrictions on data availability

Compound characterization by ^1H NMR shown in Figures S22-27; PPant ejection data shown in Figure S11; Representative HRMS traces and MS2 analyses for all turnovers shown in Figures S28-33; crystal structures have been uploaded to the PDB under codes 7KVV, 7KW0, 7KW2 and 7KW3.

Field-specific reporting

Please select the best fit for your research. If you are not sure, read the appropriate sections before making your selection.

☒ Life sciences ☐ Behavioural & social sciences ☐ Ecological, evolutionary & environmental sciences

For a reference copy of the document with all sections, see [nature.com/authors/policies/ReportingSummary-flat.pdf](https://www.nature.com/authors/policies/ReportingSummary-flat.pdf)

Life sciences study design

All studies must disclose on these points even when the disclosure is negative.

Sample size	Enzyme activity was tested using different amino acid and peptide substrates that were selected based on natural substrates and then increasing MW for the amino acid acceptor substrate related works concerning the activity of enzyme homologues.
Data exclusions	No data was excluded
Replication	Turnover experiments were all performed in triplicate together with appropriate controls, unless specifically noted in the text.
Randomization	Not possible due to the different physical properties of the peptide substrates involved
Blinding	Not relevant

Reporting for specific materials, systems and methods

Materials & experimental systems

n/a	Involved in the study
