

CCT3, Exposure time: 15s

CCT3, Exposure time: 30s

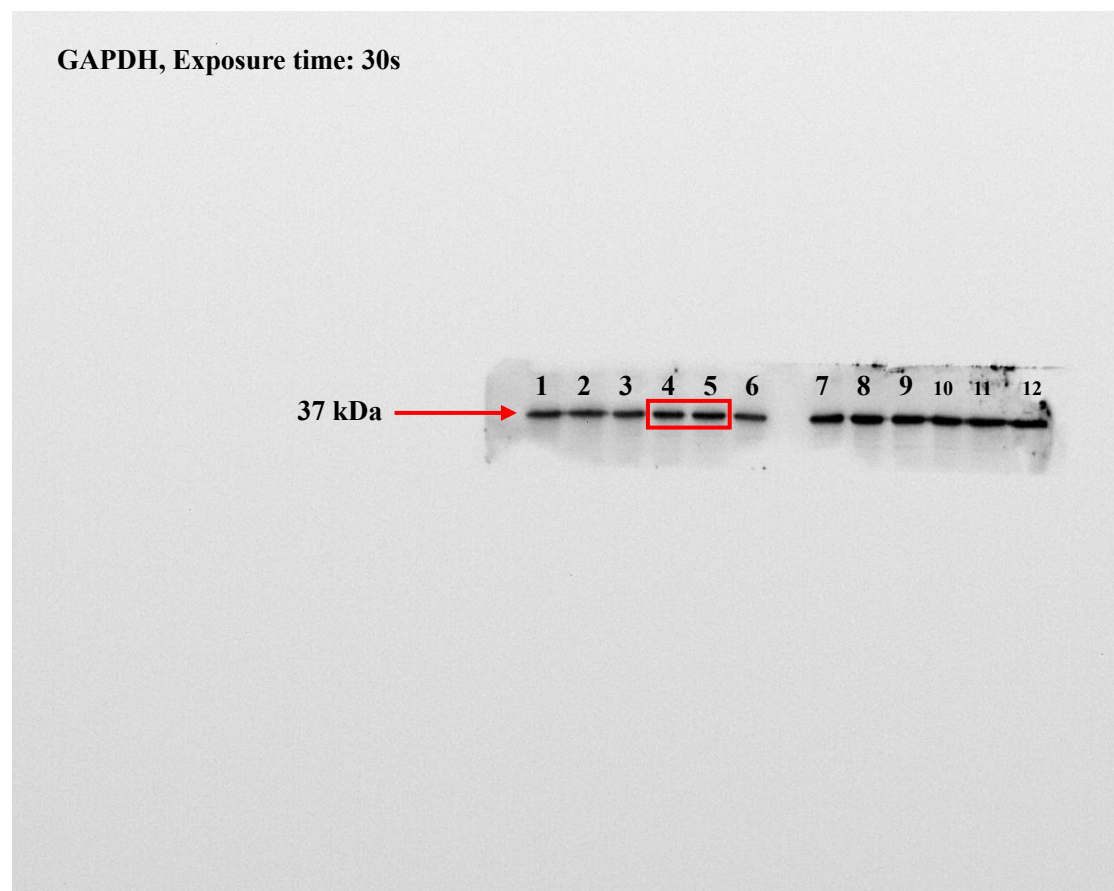

Notes:

Upper and lower figures represent the exposure time of 15 and 30 seconds, respectively.

The experiments were performed in triplicate. Lanes 1, 3 and 5: Si-CCT3; Lanes 2, 4 and 6: Si-Control. The cropped part is shown in red box.

Lanes 7-12 represent CCT3 expression in different cell line used in another research program, with another treatment and for different purposes.

The extra bands shown in the figures maybe resulted from the antibody used in this study. Polyclonal antibodies may perform better in some conditions, for example, they have an advantage of increased sensitivity for target protein while the specificity is undermined by non-specific background.

Notes:

The experiments were performed in triplicate. Lane distribution is in accordance with CCT3 experiments. The cropped part is shown in red box.
