

Supplemental Figure 1. Differentially abundant family level bins between insectary and environment colonized mosquitoes. The bar graphs on the left side of each figure display the mean proportion of sequences belonging to each family. The dot plots display the difference in mean proportions between the insectary and environment colonized mosquitoes with the associated P-value of the test statistic (2-sided Welch's T-test, corrected for multiple testing with Storey false discovery rate calculation). Error bars on both the bar and dot plots represent the 95% confidence intervals.
