

Appendix

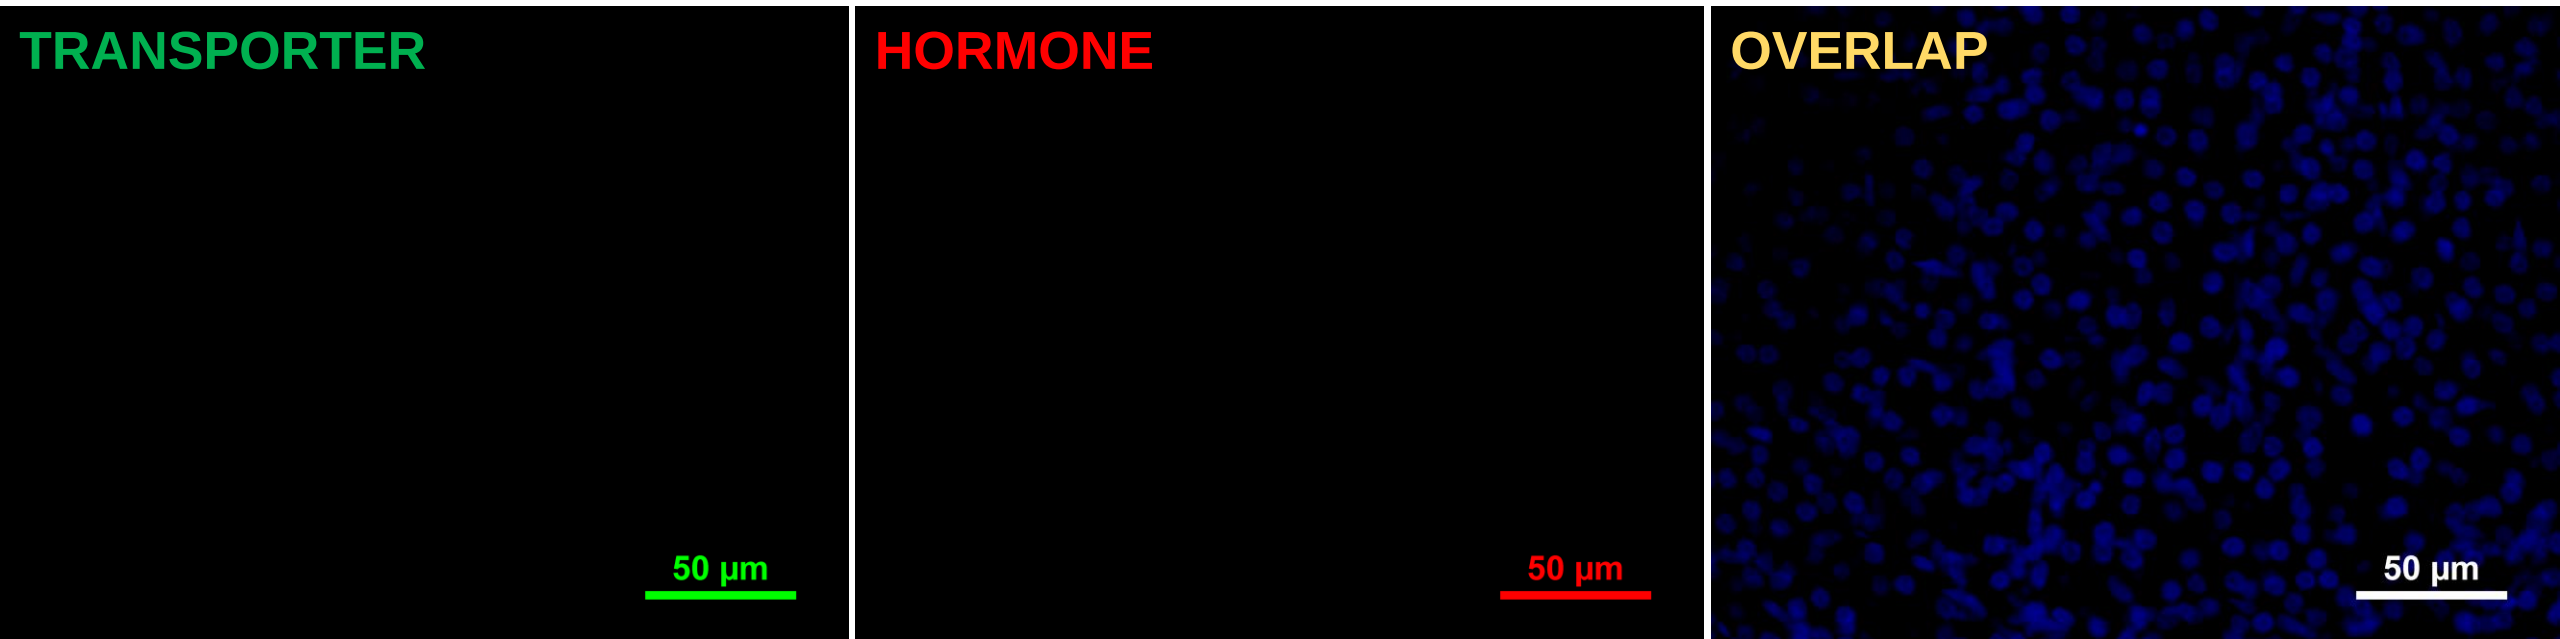

Fig. 4 Representative immunofluorescence images of the negative controls of formalin-fixed paraffin-embedded human adult pancreas sections. Sections were incubated without primary antibodies for P-glycoprotein and BCRP (transporter) as well as insulin and glucagon (hormone). In this section from a 62-year-old female subject, efflux transporter is labelled in green, hormone is labeled in red, DAPI nuclear stain is labeled in blue, and the transporter-hormone overlay in yellow. Images are shown at 40x magnification. *Scale bar 50 µm.*
