| Pedagogy * Gender * age: |          |       |                         |         |        |        |
| (T – M) * (M – F) * age  | .09654   | .0352 | .0266                   | .16648  | 2.746  | .007   |

*Note.* <sup>a</sup> Represents reference level \* represents an interaction. In the predictor column, M below Gender represents male, while F represents female; in the same column, T below Pedagogy represents traditionally schooled children, while M represents Montessori schooled children.

**Figure S1**

*Estimated Marginal Means in Linear Regression Factors Predicting Hippocampus Volume With Age in 3-12 Years Old Schooled Children*

*Note.* Age significantly predicted a global increase in the hippocampus volume for Montessori and traditionally schooled children ( $M=0.580$ ,  $SE=0.004$ ).

**Figure S2**

*Estimated Marginal Means in Linear Regression Factors Predicting Hippocampus Volume With Pedagogy in 3-12 Years old schooled children*

*Note.* Pedagogy significantly predicted a higher increase in hippocampus volume for Montessori schooled children ( $M=0.583$ ,  $SE=0.006$ ) compared to traditionally schooled children ( $M=0.576$ ,  $SE=0.006$ ).

**Figure S3**

*Estimated Marginal Means in Linear Regression Factors Predicting Hippocampus Volume in 3-12 Years Old Schooled Children; Age and Pedagogy Interaction*

*Note.* Across development, the pedagogy significantly predicted increased hippocampus volume for Montessori schooled children ( $M=0.583$ ,  $SE=0.006$ ). In contrast, a decrease in the hippocampus volume was observed for the traditionally schooled children ( $M=0.576$ ,  $SE=0.006$ ). M represents Montessori schooled children, and T represents traditionally schooled children within Pedagogy.

**Figure S4**

*Estimated Marginal Means in Linear Regression Factors Predicting Hippocampus Volume in 3-12 Years Old Schooled Children; Gender and Pedagogy Interaction*

*Note.* Males, in general, for both pedagogies, showed a smaller volume in the hippocampus than females. However, male Montessori schooled children showed a bigger hippocampus volume ( $M=0.571$ ,  $SE=0.009$ ) than male traditionally schooled children ( $M=0.567$ ,  $SE=0.009$ ). Female Montessori schooled children showed a bigger hippocampus volume ( $M=0.596$ ,  $SE=0.009$ ) than female traditionally schooled children ( $M=0.586$ ,  $SE=0.009$ ). M represents Montessori schooled children, T represents traditionally schooled children within Pedagogy, F represents females, and M represents males within Gender.

**Figure S5**

*Estimated Marginal Means in Linear Regression Factors Predicting Medial Prefrontal Cortex (mPFC) Volume in 3-12 Years Old Schooled Children; Pedagogy, Age and Gender Triple Interaction*

*Note.* Across development, the pedagogy significantly predicted differences of gender in the volume of the mPFC for Montessori schooled children; females had a slight increase in the volume of the mPFC while males had a decrease. Conversely, female traditionally schooled children had a decrease across development in the volume of the mPFC while male traditionally schooled had an increase. M represents Montessori schooled children, T represents traditionally schooled children while F represents females, and M represents males within Gender.
