

The reasons for developing the separating glue separately in WB experiment are as follows::

1. The molecular weight of GAPD (67 kDa) and GAPDH(36kda) is different, and the development is not affected by separate glue cutting.

Cut the glue from the position shown in the following figure.

2. Separate glue cutting can save samples. The VPA modeling process is complicated and has a long period, and samples are not easy to obtain. Although developed separately, the processing conditions of the two strips are completely the same.
