Supplementary Figure 2. Detection of human SERPINA4 accumulation in total circulating in HC, PD, and MSA plasma by sandwich ELISA. (A) Standard curve of the SERPINA4 ELISA Standards were prepared by two-fold serial from 1500 pg/ml to 23.3475 pg/ml to show $R^2 = 0.9956$. (B) The total circulating human SERPINA4 accumulation in the plasma of HC and MSA. An unpaired Student's t test was performed to determine the statistical significance of the different comparisons, yielding a p -value.
