

Figure 6-supinfo. Evolution of the viral load (expressed by log₁₀ copies per milliliters) and absolute lymphocytes count (10³/mm³) in **Recipient 2**. The Preoperative RT-PCR test was negative on POD 0. The horizontal orange line represents the inferior limit of the absolute lymphocyte count. We can observe a progressive lymphopenia while the viral load increases to reach a peak on POD 19.

#POD, postoperative day; RT-PCR, reverse transcriptase polymerase chain reaction.

*Absolute lymphocyte count normal range (1,10-3,7.10³/mm³)
