

Supplementary Figure 3

Figure S3. Transcriptomic data. (A) Principal component analysis (PCA) of RNA-seq measurements from 40 experimental mice in female and male treated by LPS or PBS. One sample was an outlier and was excluded from further analysis. (B-E) Volcano plots of differentially expressed genes (DEGs) in these animals. DEGs were defined as those with fold-change ≥ 2 at adjusted p-value (q-value) < 0.05 .
