

Ancient genomes of Sitka black-tailed deer show evidence for postglacial stepping-stone
dispersal along the Pacific Northwest Coast of North America

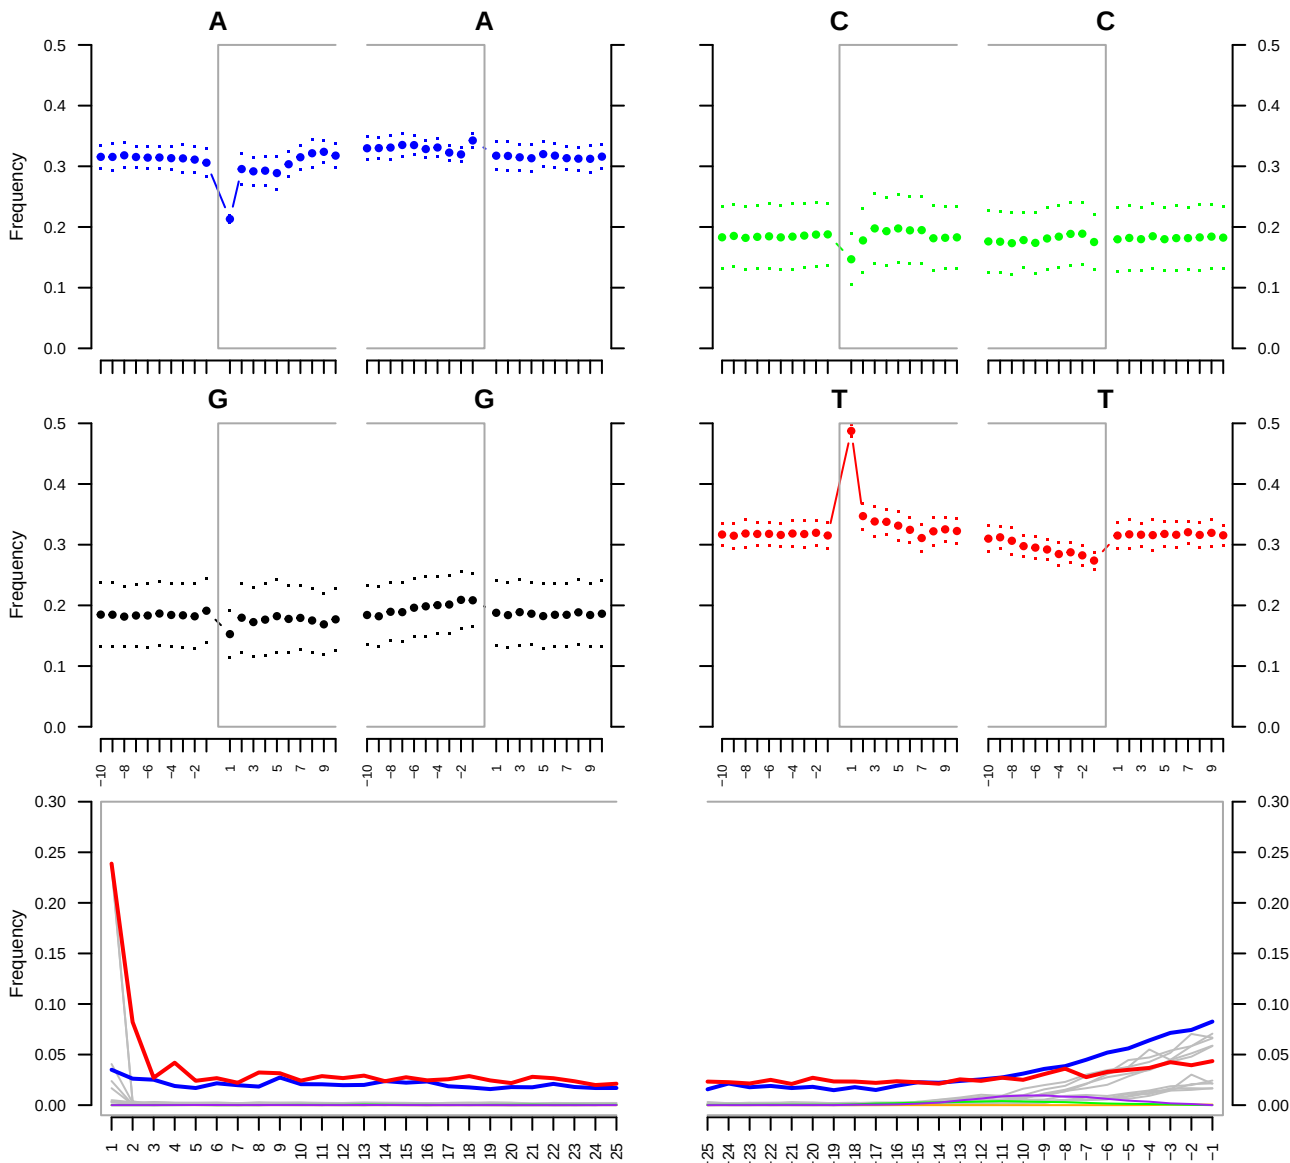

Supplementary Figures

Figure S3.1 DNA damage profiles showing patterns of fragmentation and misincorporation for the ancient mitogenomes, generated using mapDamage2 (Jónsson, et al. 2013)	2
Figure S3.2 DNA damage profiles showing patterns of fragmentation and misincorporation for the ancient whole-genomes, generated using mapDamage2 (Jónsson, et al. 2013)	23
Figure S3.3 A tip calibrated Bayesian phylogenetic tree constructed with BEAST2, showing the complete tree Figure 2	38
Figure S3.4 Maximum likelihood tree of complete deer mitogenomes generated with IQ-TREE with 1,000 bootstraps	39
Figure S3.5 Principal component analyses of <i>Odocoileus hemionus</i> genomes showing PC1 to PC6.	40
Figure S3.6 Linear regression of PC values from Vancouver Island individuals over time	42
Figure S3.7 Maximum likelihood tree of modern deer SNPs generated with IQ-TREE with 1,000 bootstraps	44
Figure S3.8 QuiBL Pairwise average fractions of introgression between <i>Odocoileus</i> samples generated with QuiBL based on branch length information in 286 maximum likelihood trees	44
Figure S3.9 NGSAdmix of modern and ancient <i>Odocoileus hemionus</i> plots showing K=3 to K=7	45
Figure S3.10 <i>f</i> ₃ -statistics plots showing all possible combinations for modern <i>Odocoileus hemionus</i> , and ancient with a depth of coverage above 0.5x as a target.	46
Figure S3.11 TreeMix of the dataset only including modern deer, showing migration edges from 0 to 10.	52
Figure S3.12 Manhattan plot of F _{st} outliers comparing Sitka and Columbian black-tailed deer on the 22 larges scaffolds. Red line represents the 99 percentile (0.6).	53
