

Supplemental Figure 4. Rapid production of free K63-linked polyubiquitin chains in cells exposed to Ang II. VSMC were serum-starved for 24 hours and then exposed to Ang II (100 nM) for the indicated times. WCE were prepared and subjected to GST or GST-ZnF UBP pull-down. GST-ZnF UBP-trapped proteins were treated with or without IsoT (200 nM) prior to immunoblotting analysis using both antibodies at the same time. Data are representative of a minimum of 3 independent experiments..
