SUPPLEMENTARY FIGURE LEGENDS:

Supplementary Figure 1 MiniMUGA genetic background analysis. (A) Control (*Stxbp1*^{+/+}*Snap25*^{+/+}) samples from laboratory 1 were of excellent quality and analysis revealed the presence of 96.4% C57BL/6J substrain diagnostic SNP probes as a primary background. (B) *Stxbp1* single samples from laboratory 1 were inbred (96.5% consistency with C57BL/6J diagnostic markers) with the presence of multiple 129-strains markers in one sample and unexplained secondary background in the second sample. (C) *Stxbp1* single samples from laboratory 2 contained multiple C57BL6 sub-strains background markers, with dominant C57BL/6JBomTac sub-strain and several clusters with 129-strains markers. (D) Two *Snap25* single samples from laboratory 1 were C57BL/6J inbred with the presence of multiple 129-strains markers. (E) *Snap25* single samples from laboratory 1 was C57BL/6JBomTac inbred with the presence of unexplained secondary background.

Supplementary Figure 2: Body weight and general behavior in double mutants. (A) Body weight was measured in 8 weeks old animals. (B) Vision test scored number of successful grabs to reach for the platform. (C) Grip strength test scored the amount of force that mice applied grasping a pull bar. (D) Rotarod test measured the maximum rpm reached per trial.

Supplementary Figure 3: Assessment of different aspects of cognition. (A) Representation of T-maze spontaneous alteration protocol consists of two trials: sample and test trial during which animal's working memory was assessed. (B) Percentage of alteration in the T maze for control and double mutants. (C) Representation of CognitionWall task protocol for assessment of discrimination (DL) and reversal (RL) learning. (D) Kaplan-Meier survival curves shows the fraction of control (black), *Snap25* single (green), *Stxbp1* single (blue) and double mutants

(red) that reached the 80% criterion as a function of hole entries during the DL phase. **(E)** Average number of entries made to reach the 80% criterion during DL phase. **(F)** Kaplan-Meier survival curves shows the fraction of control (black), *Snap25* single (green), *Stxbp1* single (blue) and double mutants (red) that reached the 80% criterion as a function of hole entries during the RL phase. **(G)** Average number of entries made to reach the 80% criterion during RL phase.

Supplementary Figure 4: Assessment of anxiety-related behavior in double mutants. **(A)** Time spent in open arms of elevated plus maze (EPM). **(B)** Percentage of visits to the open arms of EPM. **(C)** Total distance moved in the EPM. **(D)** Time spent in the central part of the OF. **(E)** Distance traveled in center of the OF. **(F)** Total distance moved. **(G)** Latency to visit bright compartment (BC) of the dark-light box. **(H)** Number of visits to the BC. **(I)** Time spent in BC.

Supplementary Figure 5: Calcium imaging of PFC- brain slice. **(A-B)** Percentage of active cells (A) and frequency of their activity (B) at baseline and after application of gabazine in PFC-brain slices from control, *Snap25* single-, *Stxbp1* single-, and double mutants.

Supplementary Figure 6: Assessment of spontaneous release in excitatory and inhibitory hippocampal autaptic neurons. **(A)** Typical spontaneous release traces in control, *Snap25* single-, *Stxbp1* single- and double- mutants glutamatergic neurons **(B)** Normalized frequency of spontaneous release (mEPSC) of glutamatergic neurons per week. mEPSC frequency was significantly lower in double mutants glutamatergic neurons compared to control group. **(C)** Normalized amplitude of mEPSC per week. **(D)** Typical spontaneous release traces in control-, *Stxbp1* single-, *Snap25* single- and double mutants GABA-ergic neurons **(E)** Normalized

frequency of spontaneous release (mIPSC) of GABA-ergic neurons per week. **(F)** Normalized amplitude mIPSC per week. ** p< 0.01.

Supplementary Figure 7: Morphological analysis of ICH-stained dissociated hippocampal neurons. **A)** Dissociated hippocampal neurons were stained for morphological marker (MAP2) and glutamatergic marker (VGLUT). Examples represent control, *Snap25* single-, *Stxbp1* single- and double- mutants neurons. **B-E)** Quantification of several morphological parameters in glutamatergic neurons: B) Total dendritic length. C) Synaptic density. D) Synaptic size and E) Synaptic intensity. **F)** Dissociated hippocampal neurons were stained for morphological marker (MAP2) and GABAergic marker (VGAT). Examples represent control, *Snap25* single-, *Stxbp1* single- and double- mutants neurons. **B-E)** Quantification of several morphological parameters in GABAergic neurons: B) Total dendritic length. C) Synaptic density. D) Synaptic size and E) Synaptic intensity.
