Reliability	TIF	    	    	    	    	
	full responses with TIF>3.3	98.6%	98.6%	99.2%	97.1%	100%

A: 5-point Likert scale

B: 4-point Likert scale

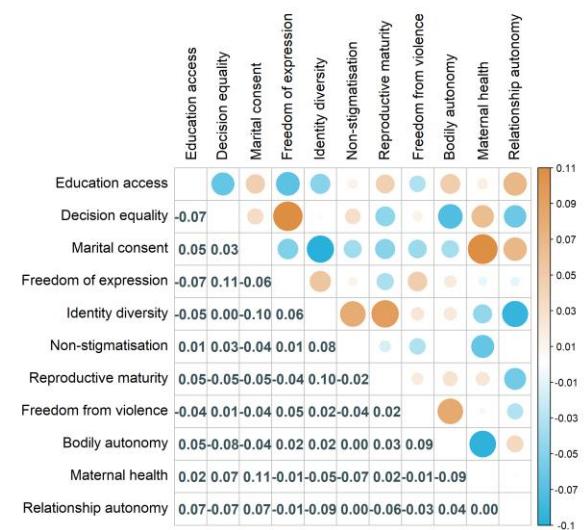

Figure A Results of the local dependence analysis. Shown is the exceedance of Yen's Q3 statistics over the mean value of these statistics in the data set. Values above 0.2 are considered indicative of local dependence.

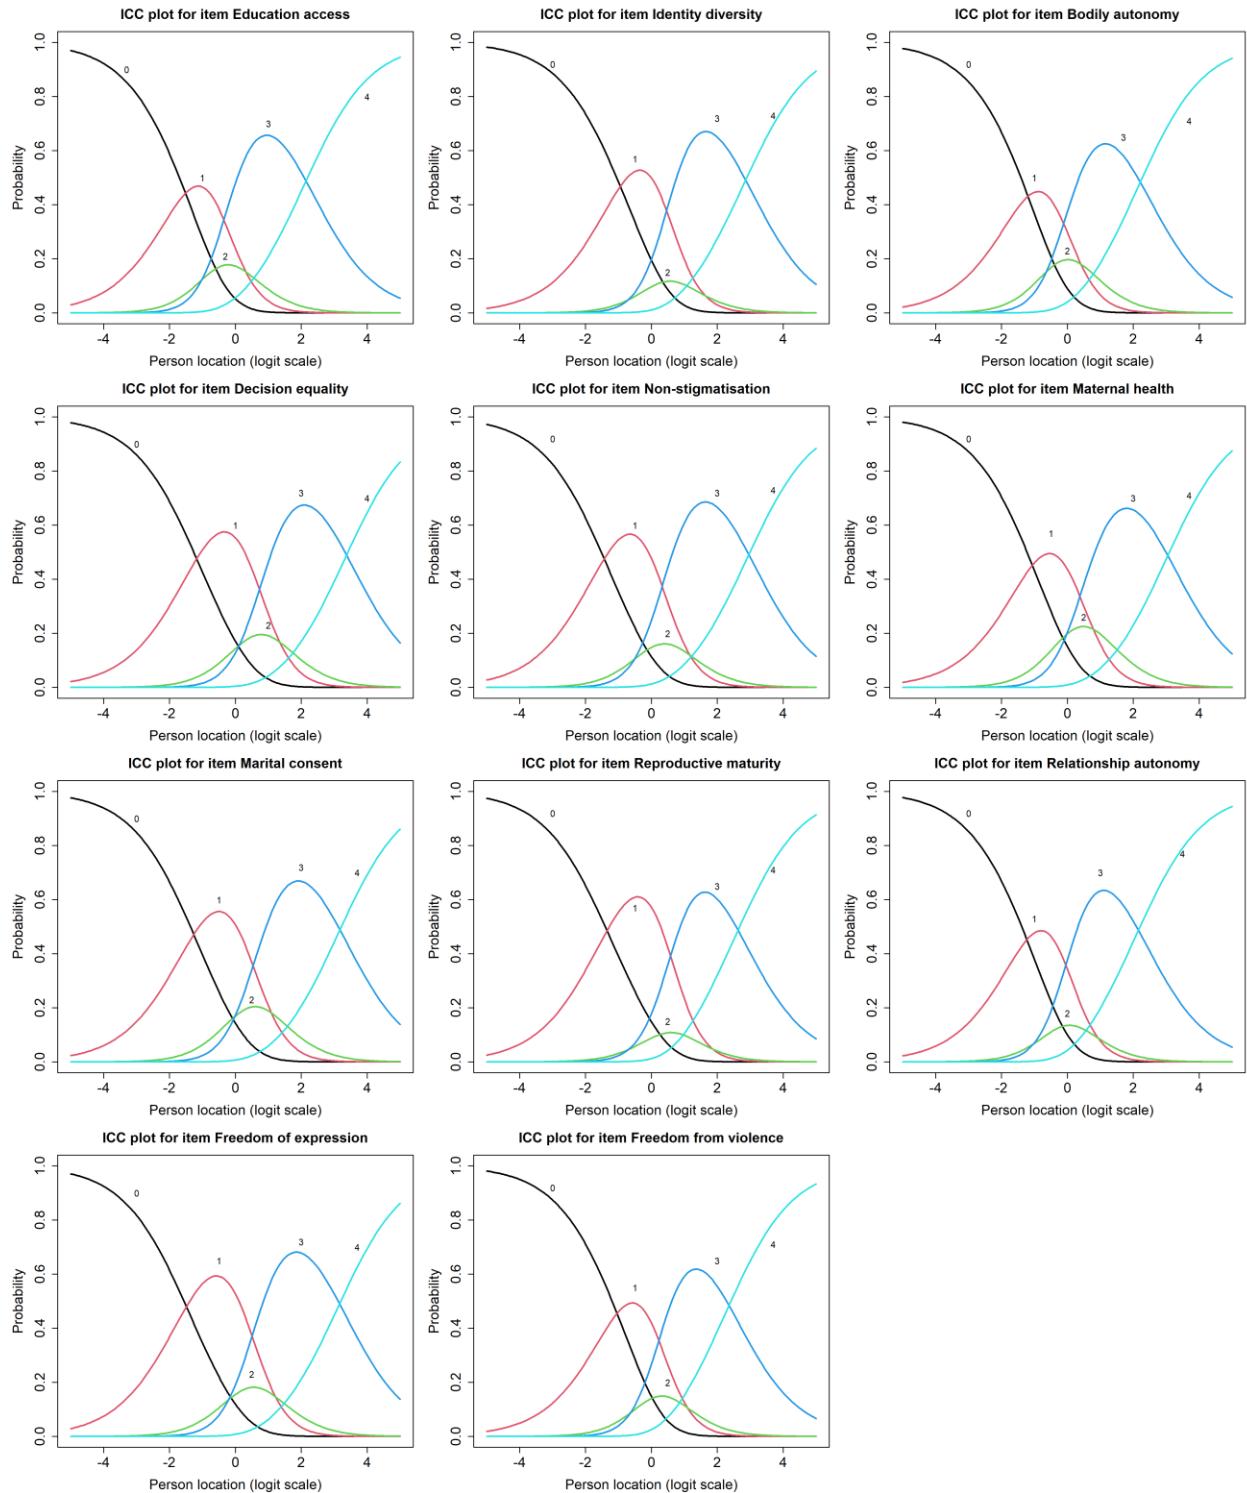

Figure B Item characteristic curves for the original 5 response options on the 5-point Likert scale. The middle response option (labelled as 2) is always disordered.

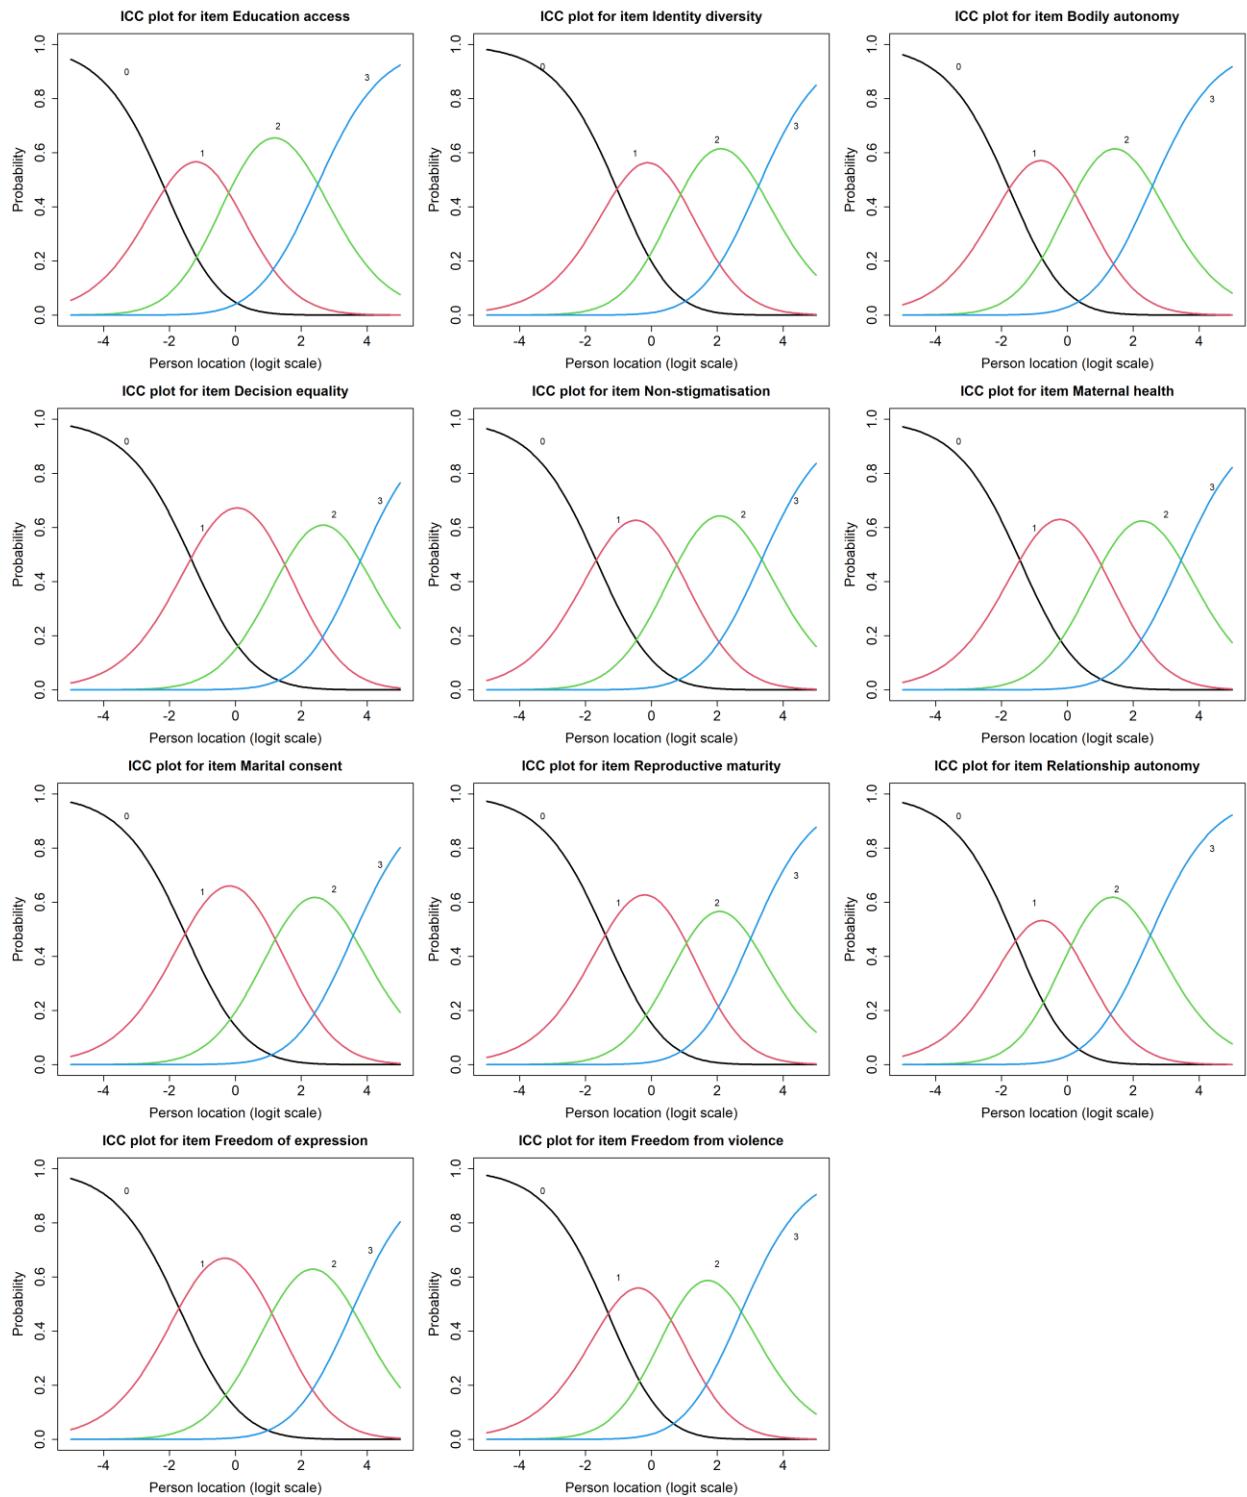

Figure C Item characteristic curves after collapsing the 5-point Likert scale into a 4-point one. All items show ordered response categories.

Table B Outfit and infit statistics for the 5-point Likert scale (right) and the modified 4-point Likert scale (left). Statistics indicating overfit (<-2 in normalized infit and outfit, <0.7 in mean square infit and outfit) and underfit (>2 in normalized infit and outfit, or >1.3 in mean square infit and outfit) are in bold.

Outfit and infit statistics based on 100 subsamples of size 350	5-point Likert scale				4-point Likert scale			
	Mean square outfit	Mean square infit	z-outfit	z-infit	Mean square outfit	Mean square infit	z-outfit	z-infit
Education access	0.91	0.92	-0.95	-0.99	0.95	0.95	-0.71	-0.67
Decision equality	1.08	1.05	1.27	0.82	1.02	1.01	0.23	0.14
Marital consent	1.19	1.13	2.80	2.01	1.08	1.06	1.00	0.84
Freedom of expression	0.94	0.91	-0.95	-1.48	0.89	0.89	-1.50	-1.56
Identity diversity	0.88	0.86	-1.83	-2.39	0.84	0.83	-2.38	-2.51
Non-stigmatisation	1.05	1.02	0.68	0.34	1.00	1.00	0.07	-0.01
Reproductive maturity	0.92	0.90	-1.31	-1.70	0.88	0.87	-1.78	-1.90
Freedom from violence	0.78	0.78	-3.38	-3.63	0.77	0.76	-3.42	-3.62
Bodily autonomy	0.81	0.85	-2.49	-2.10	0.81	0.82	-2.68	-2.57
Maternal health	0.97	0.95	-0.45	-0.85	0.92	0.91	-1.18	-1.29
Relationship autonomy	1.00	1.00	0.06	0.03	0.97	0.98	-0.34	-0.29

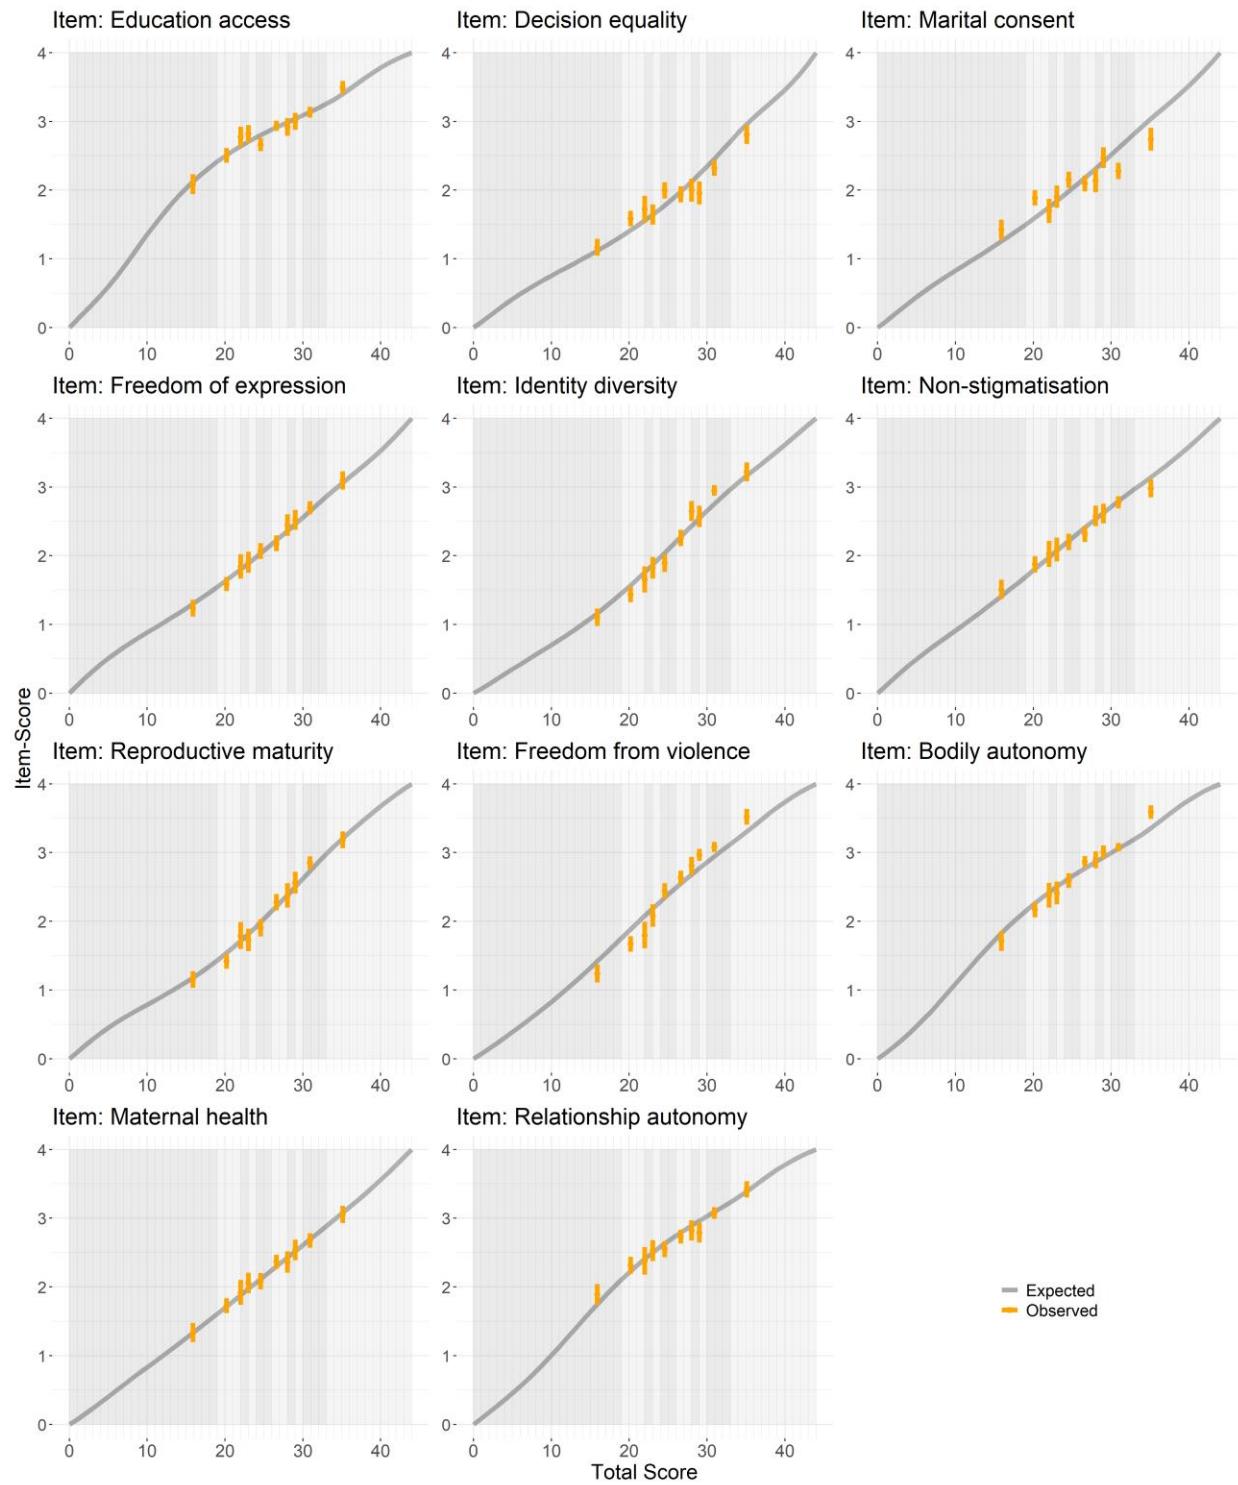

Figure D CICC plots based on the 5-point Likert scale contrasting the model predicted mean score (expected) with the observed average score conditional on the total score. The shading indicates the range of total scores of the participants who were involved in the calculation of the average observed score on that item.

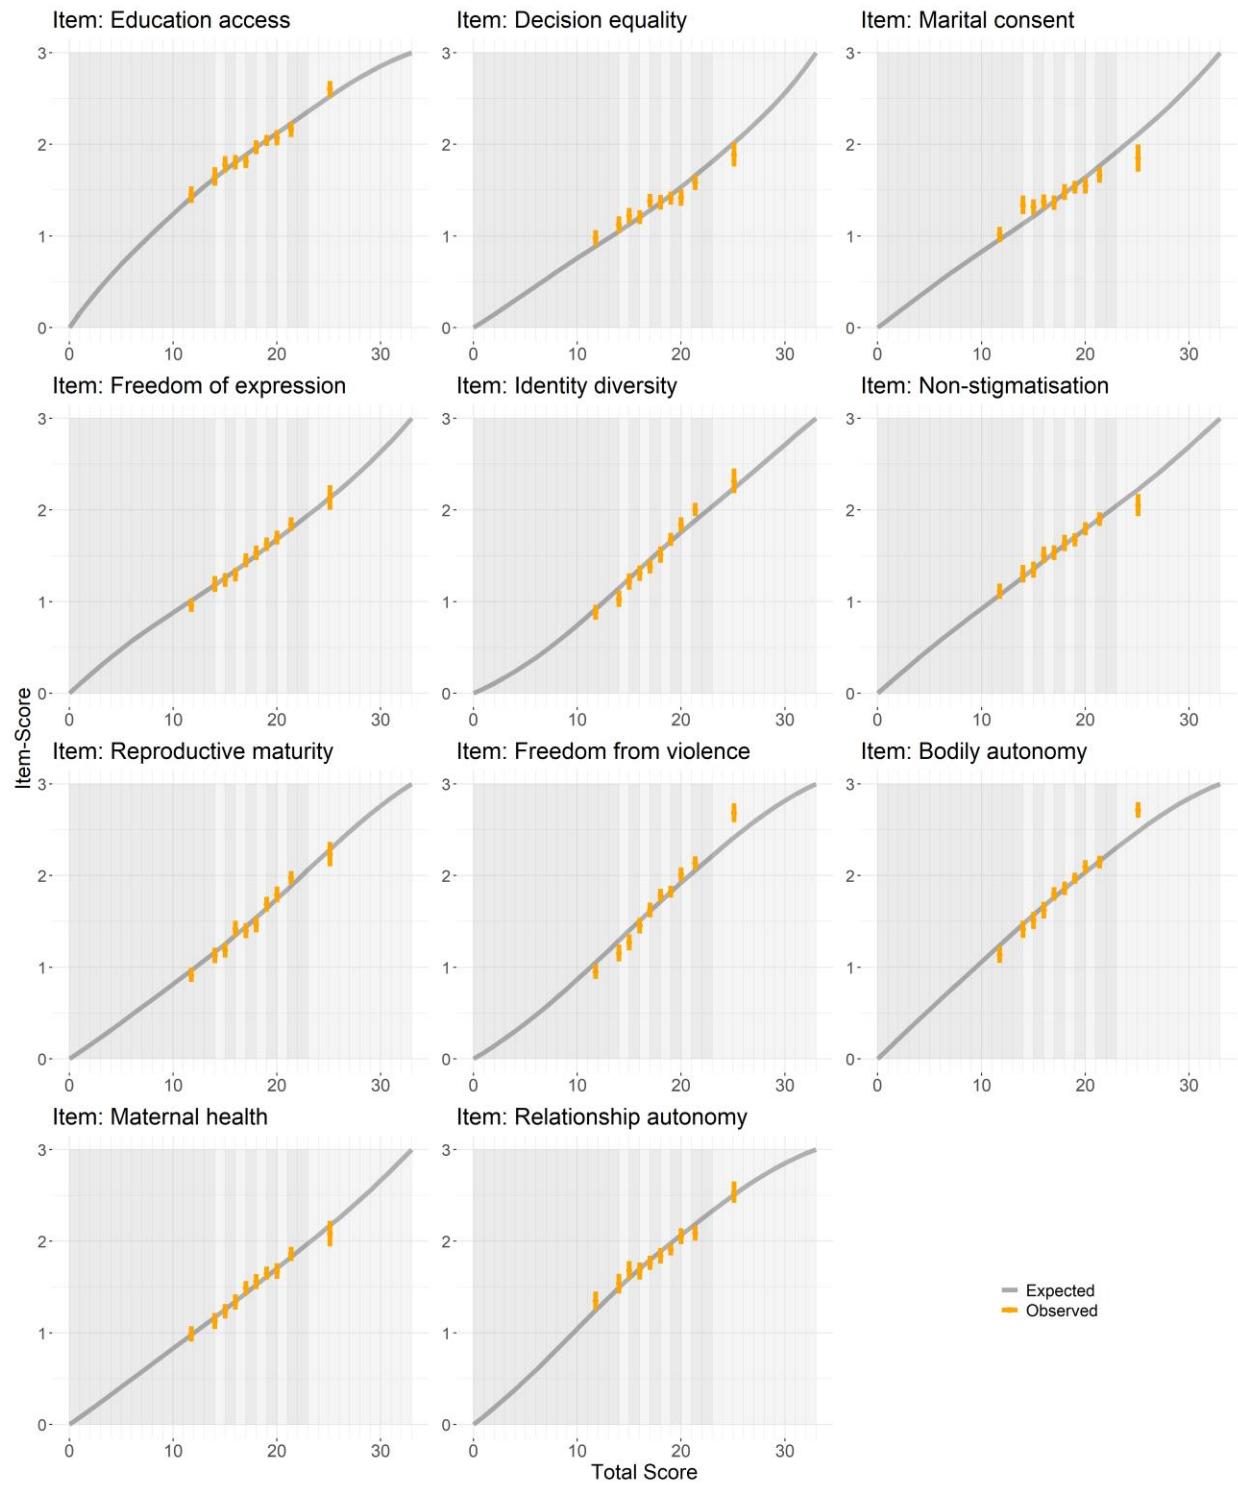

Figure E CICC plots based on the 4-point Likert scale contrasting the model predicted mean score (expected) with the observed average score conditional on the total score. The shading indicates the range of total scores of the participants who were involved in the calculation of the average observed score on that item.

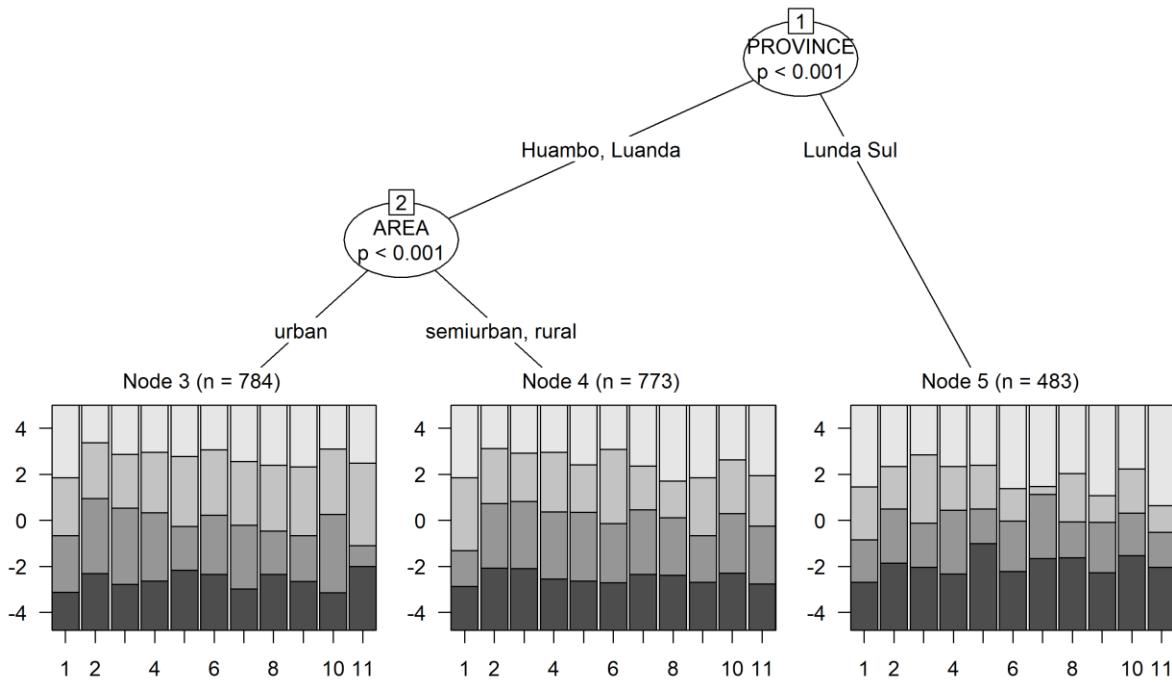

Figure F Partial credit tree based on 2040 participants, who have full information on the splitting characteristics: province, household wealth, literacy and living area type. The strongest difference in functioning was identified between provinces, where Lunda Sul seems to be markedly different from the other two. In the next step, Huambo and Luanda participants are split according to the area type. However, this split is very close to a split along the provinces themselves, since 0% of Huambo participants and 88% of Luanda participants are living in what is classified as urban areas. Province is also providing the second-best split in node 2. That is why we further examined DIF according to provinces.

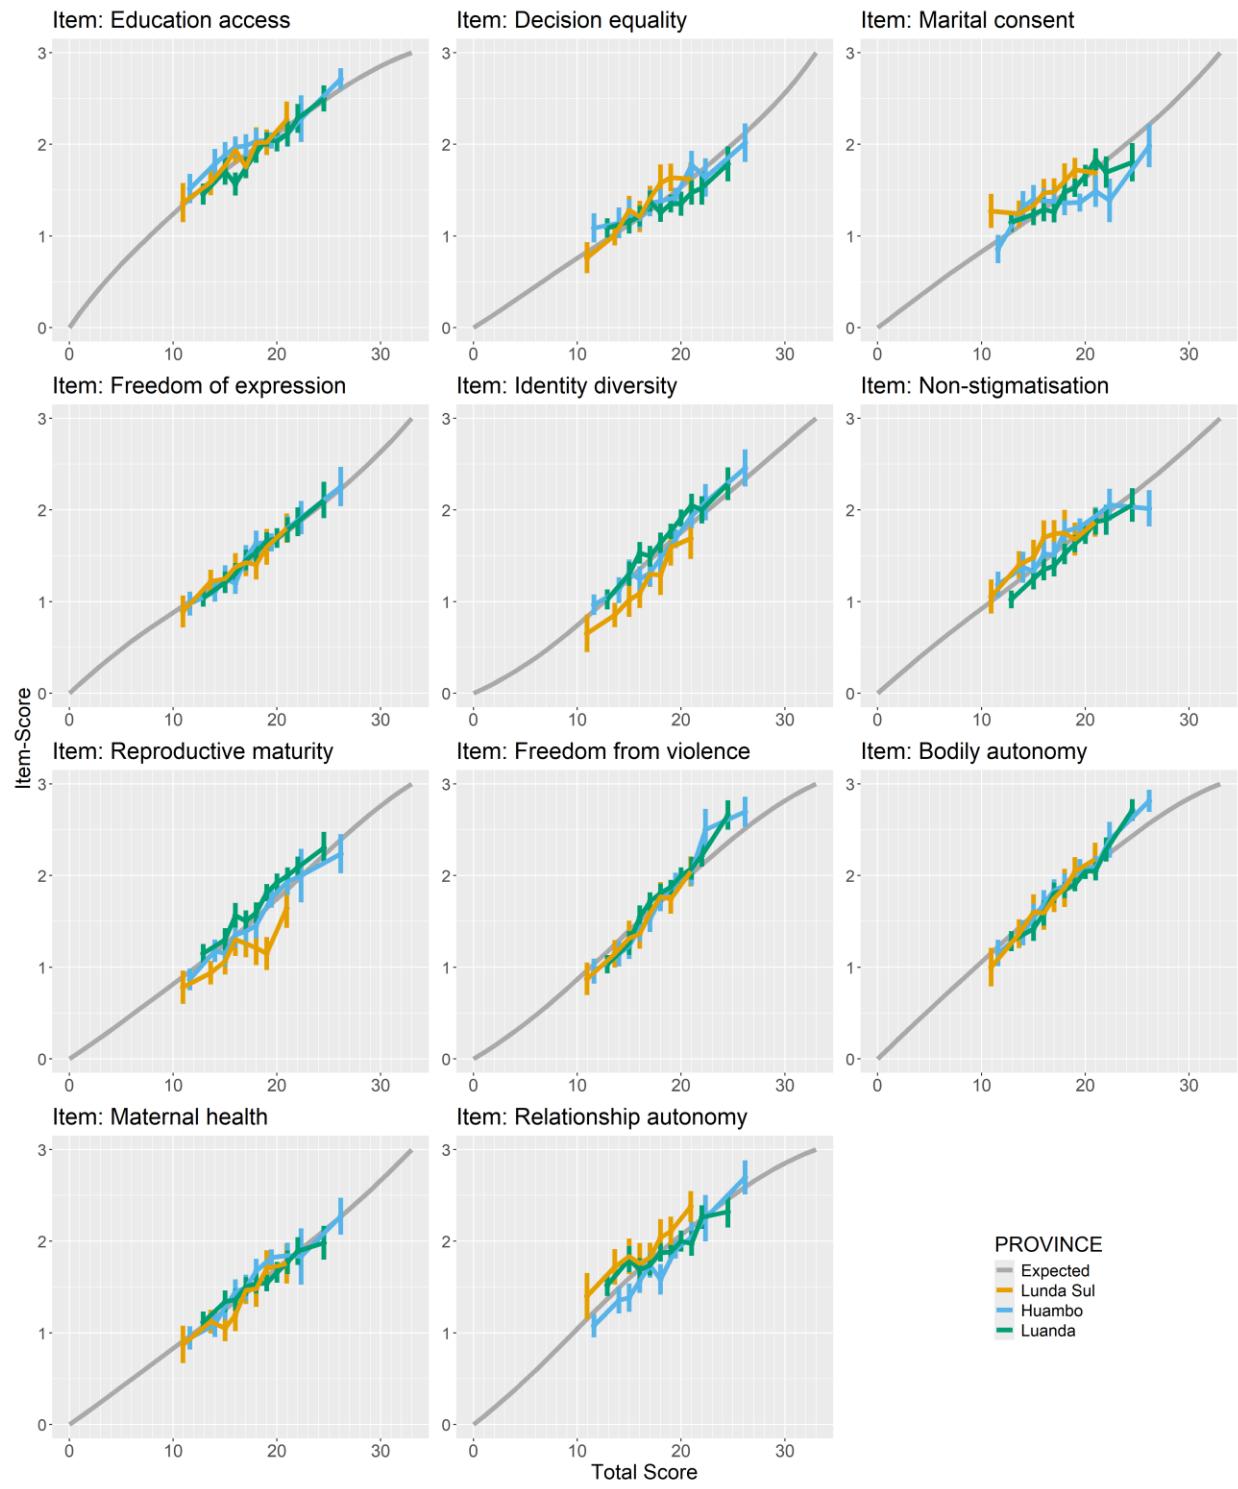

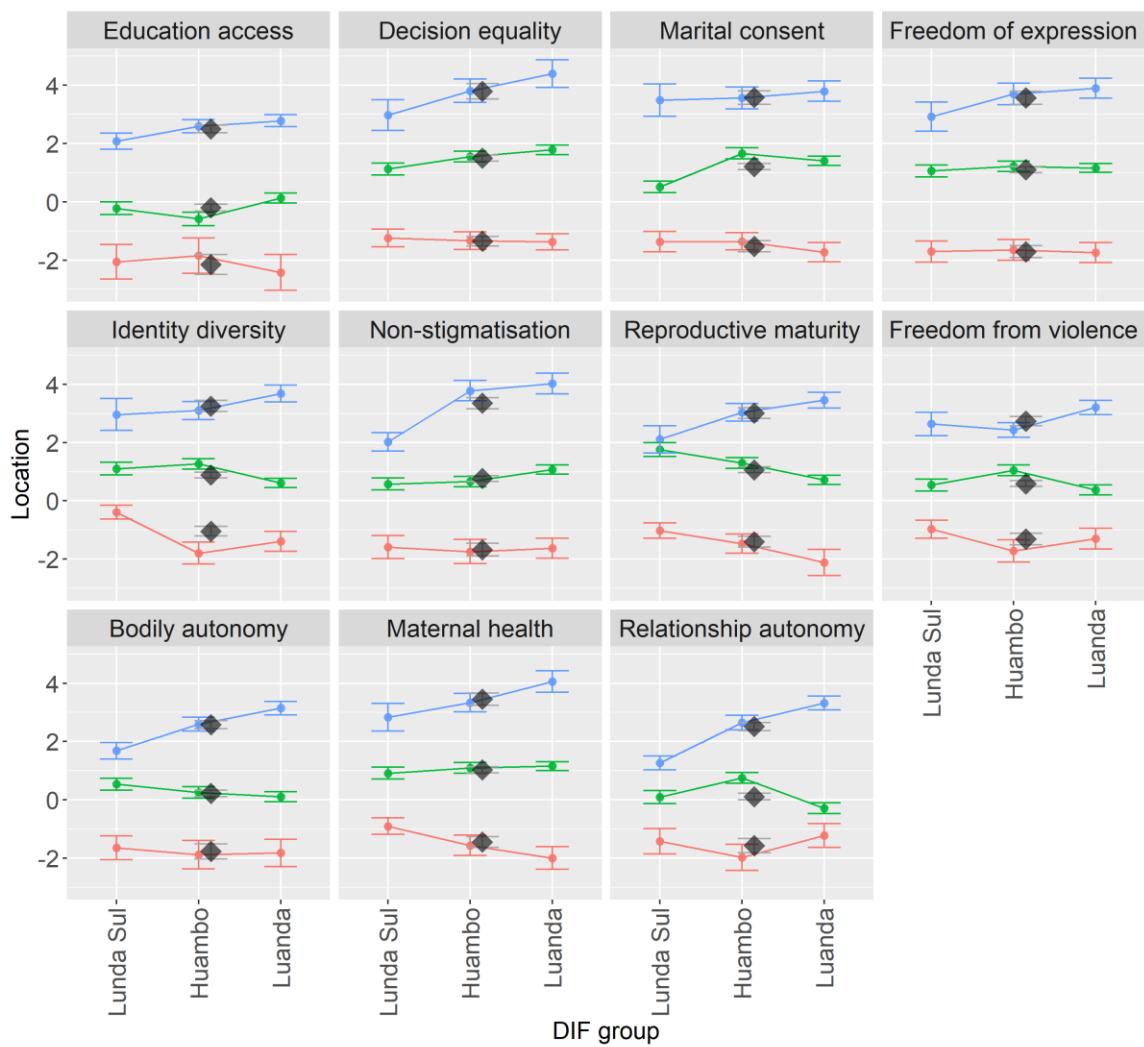

Figure G DIF plot by province. Conditional on total score, the observed average scores on an item within each province are contrasted with the mean score predicted by the model that does not account for DIF.

Item threshold locations

Note. Error bars indicate 95% confidence interval.

Dark grey diamonds indicate item location for all participants as one group.

Figure H Comparison of item threshold locations (T1 red, T2 green and T3 blue) as estimated in the provinces. For Freedom of expression the lines are almost parallel; thus, this item seems to function very similar across the provinces.

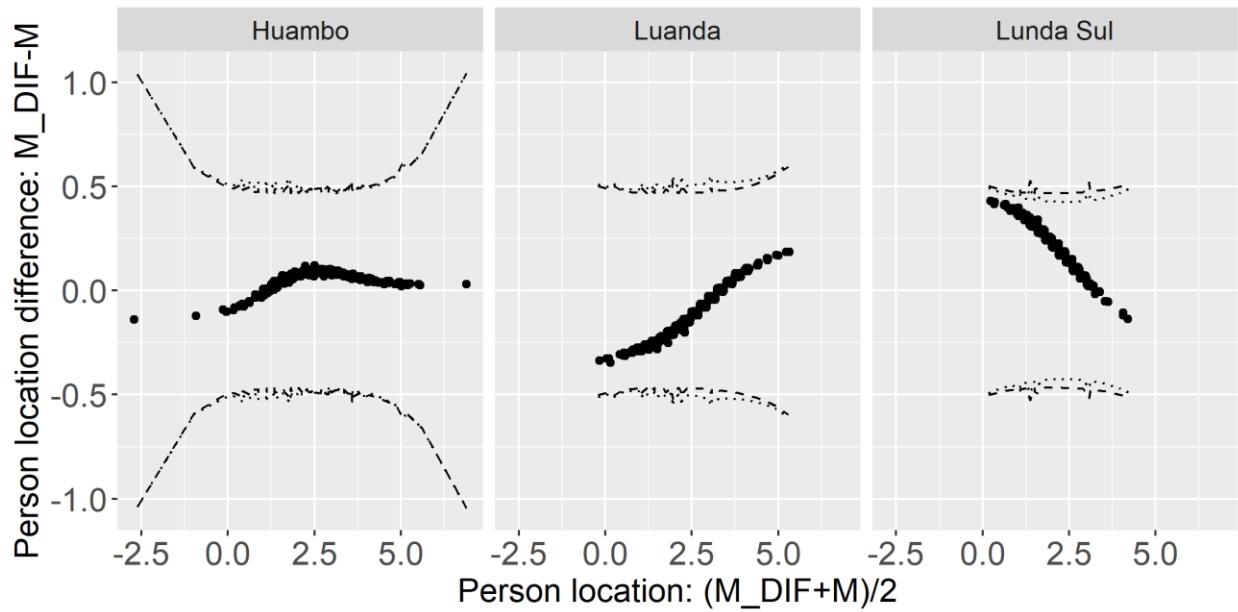

Figure I Bland-Altman plot comparing the estimated persons' locations based a model common for all three provinces (M) and on a model accounting for DIF by province (M_DIF), i.e. a model in which all items, but Freedom of expression, are province specific. The item Freedom of expression was judged as functioning the same across the provinces based on Figure G and H. The dashed(dotted) lines are the standard deviations from the estimation when ignoring (accounting for) DIF. The differences in persons' locations under the two models (y-axis) are within the uncertainty accompanying the estimation. We can see that the impact of DIF is more pronounced in Luanda and Lunda Sul, increasing the spread of persons' locations in the former and decreasing the spread in the latter case.

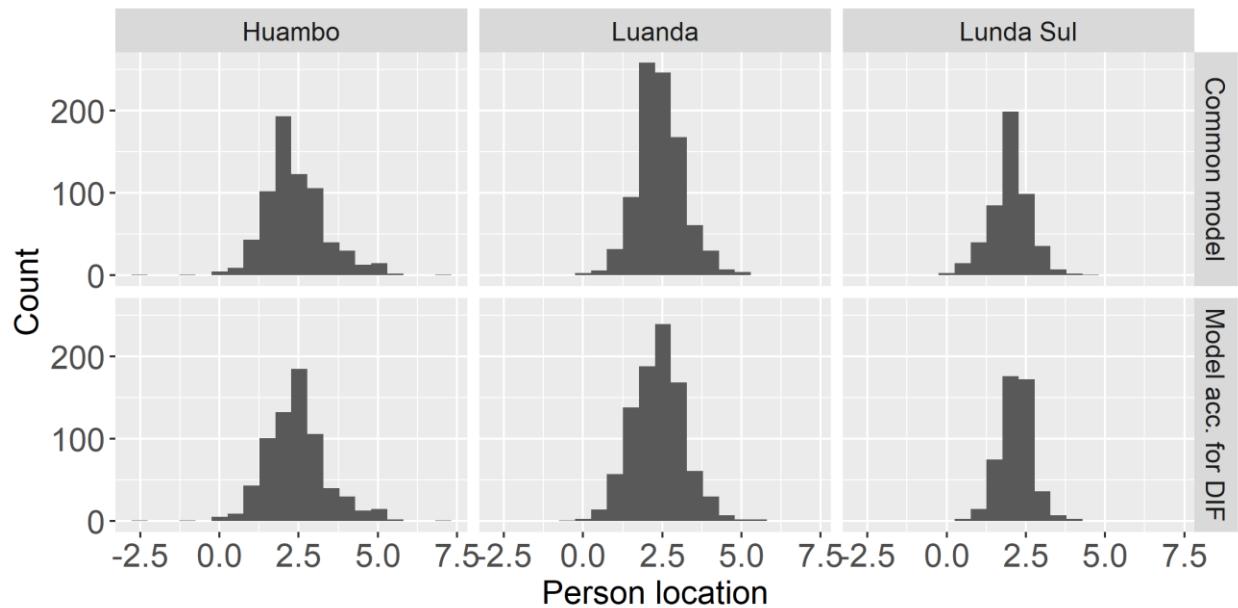

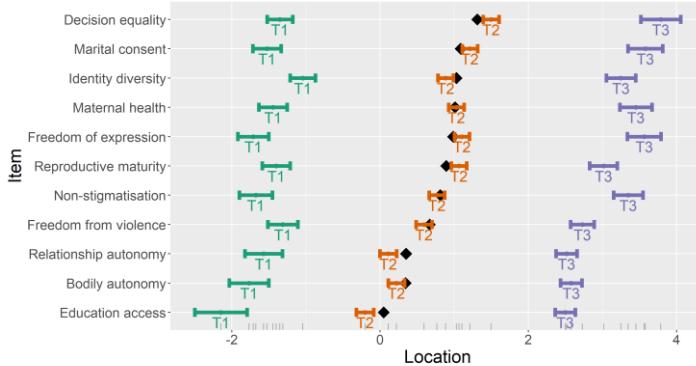

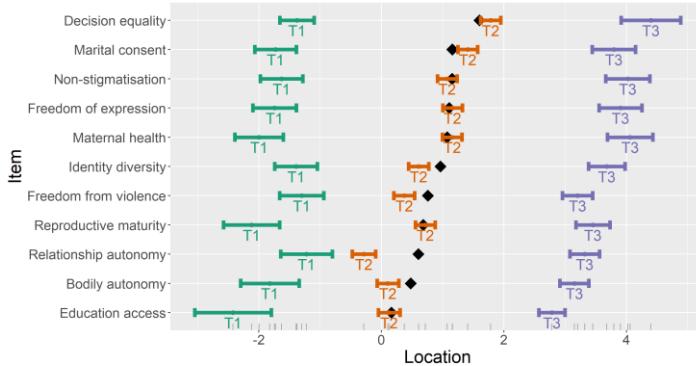

Figure J Histograms of persons' locations in the three different provinces when ignoring DIF (upper row) and when accounting for DIF (lower row). When accounting for DIF the spread of the values increases in Luanda and decreases in Lunda Sul.

All

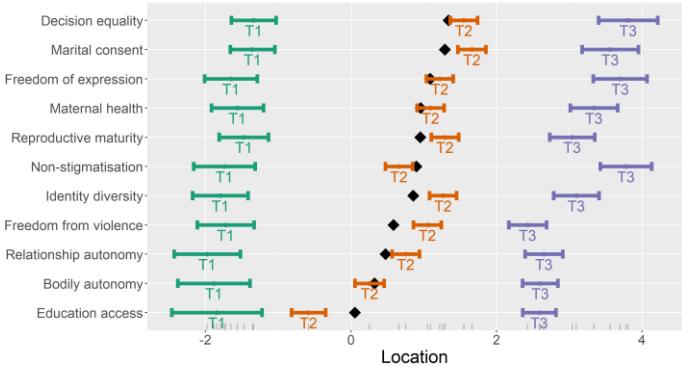

Note. Item locations are indicated by black diamond shapes.
 Item threshold locations are indicated by colored dots and colored text.
 Horizontal error bars indicate 95% confidence intervals around threshold locations.

Luanda

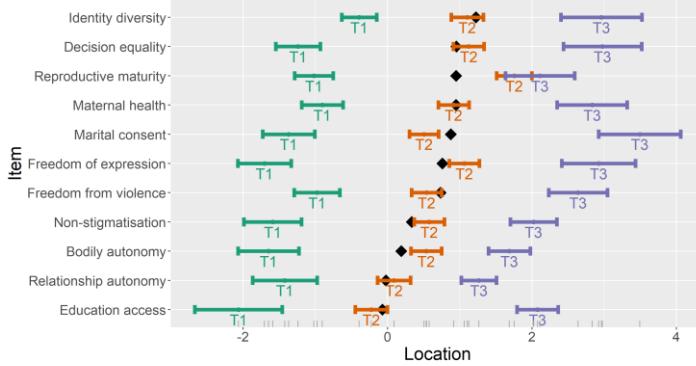

Note. Item locations are indicated by black diamond shapes.
 Item threshold locations are indicated by colored dots and colored text.
 Horizontal error bars indicate 95% confidence intervals around threshold locations.

Huambo

Note. Item locations are indicated by black diamond shapes.
 Item threshold locations are indicated by colored dots and colored text.
 Horizontal error bars indicate 95% confidence intervals around threshold locations.

Lunda Sul

Note. Item locations are indicated by black diamond shapes.
 Item threshold locations are indicated by colored dots and colored text.
 Horizontal error bars indicate 95% confidence intervals around threshold locations.

Figure K Item specific thresholds (with 95% confidence intervals) and item locations(diamonds) as estimated in the overall and the stratified (by province) analyses. From bottom to top, the items are ordered from the “easiest” to the “most difficult” as judged by their location on the logit scale.
