DOI: https://doi.org/10.21203/rs.3.rs-757296/v1
Abstract

Objective To evaluate the pharmacokinetics and bioequivalence between Sitagliptin Phosphate/metformin Hydrochloride Tablets (test formulation) at a single dose of 50mg/850mg and Sitagliptin Phosphate/metformin Hydrochloride Tablets (reference formulation, JANUMET®) at a single dose of 50mg/850mg in healthy Chinese subjects.

Methods The study was designed as a randomized, open-label, two-period double-crossover trial. A total of 24 volunteers under fasting condition and 24 subjects under fed condition were given a single oral dose of 50mg/850mg Sitagliptin Phosphate/metformin Hydrochloride Tablets of test and reference, respectively. Liquid chromatography Tandem mass spectrometry (LC-MS/MS) method was used to determine the concentrations of sitagliptin and metformin in the plasma of subjects. The pharmacokinetic parameters were calculated by WinNonlin 7.0 program and the bioequivalence was evaluated by SAS 9.4 program.

Results The 90% confidence interval (CI) of geometric mean ratio under fasting condition for $C_{\text{max}}$, $AUC_{0-t}$ and $AUC_{0-\infty}$ of sitagliptin between the test group and the reference group were 101.70%-120.62%, 99.81%-105.61%, 100.27%-106.12% and metformin were 90.39%-111.48%, 94.76%-109.12%, 95.76%-110.38%. The 90% CI of geometric mean ratio under fed condition for $C_{\text{max}}$, $AUC_{0-t}$ and $AUC_{0-\infty}$ between the test group and the reference group were 102.12%-117.31%, 100.80%-107.81%, 100.82%-107.78% and metformin were 95.53%-105.22%, 92.76%-103.07%, 93.40%-104.14%. Both were generally well tolerated.

Conclusion The two formulations of Sitagliptin Phosphate/metformin Hydrochloride Tablets were bioequivalent under fasting and fed condition in healthy Chinese subjects.

Trial registration Clinical Trial Registry (trial ID: NCT04877106).

Introduction

The number of diabetic patients worldwide has reached 366 million in 2011, the number of diabetic patients will reach 552 million by 2030, according to official statistics from the International Diabetes Federation (IDF). [1] Type 2 diabetes mellitus (T2DM) accounts for 93.7 percent of the total which is currently the fastest growing type of patients and the most studied type. [2] Most of the serious complications of diabetes are macrovascular and microvascular diseases caused by accelerated atherosclerosis. The cardiovascular morbidity is 2–4 times higher in people with type 2 diabetes than in people without diabetes. [3]

Metformin is the initial treatment recommended in almost all guidelines for the initial treatment of type 2 diabetes and is widely used in the clinic. [4] However, metformin alone often fails to meet the basic requirements for glycemic control. [5] Therefore, it is necessary to use oral hypoglycemic drugs in combination to effectively manage the blood glucose of diabetic patients. Common combination
hypoglycemic drugs include Sulfonylureas, Acarbose, DPP-4 inhibitors, GLP1 receptor agonists and SGLT2 inhibitors.

Sitagliptin showed a strong and highly selective inhibition of DPP-4. DPP-4 inhibitors have a wide range of therapeutic applications. The risk of hypoglycemia is low when used alone or in combination with other drugs that do not cause hypoglycemia. And DPP-4 inhibitors did not cause weight gain. Sitagliptin improves glycemic control by inhibiting DPP4 inactivation of GLP-1 and glucose-dependent GIP. Inhibition of DPP-4 increases and prolongs the activity level of incretin, leading to a glucose-dependent increase in insulin release and a decrease in glucagon.

The combination of sitagliptin and metformin has been shown to have a significant effect on blood glucose control in patients with type 2 diabetes, and is well tolerated with a low risk of hypoglycemia. Sitagliptin Phosphate/metformin Hydrochloride Tablets are more effective than any single ingredient in the blood sugar control of type 2 diabetic patients. Currently, Sitagliptin Phosphate/metformin Hydrochloride Tablets (JANUMET®) have been approved for the treatment of type 2 diabetes. The purpose of the study is to study the pharmacokinetics of the test and reference formulations (sitagliptin 50mg and metformin 850mg) of sitagliptin and metformin tablets, and to evaluate the pharmacokinetics and bioequivalence.

**Methods**

**Compliance with Ethics Guidelines**

This clinical study protocol was approved by the Medical Ethics Committee at the Affiliated Hospital of Qingdao University and the trial was registered with the Clinical Trial Registry (trial ID: NCT04877106). All procedures were performed in compliance with the Declaration of Helsinki as well as the International Conference on Harmonization Guideline for Good Clinical Practice. All volunteers provided written informed consent before being screened for eligibility.

**Study Population**

Eligible study participants included healthy, male and female subjects aged 18–45 years with a body mass index 18-28kg/m². Subjects (including male subjects) are willing to have no family planning and voluntarily use effective contraceptive measures for the next 6 months. Subjects sign the informed consent before the trial, and have a full understanding of the content, process and possible adverse reactions. The exclusion criteria included as follows: Being allergy to the study medications, smoking, alcohol abuse, and participation in another clinical trial within 3 months. pregnant or nursing females; use of prescription or non-prescription drugs (including herbal remedies).

**Study Design**

An open-label, randomized, single-dose, two-period, crossover study was conducted at the Phase I Clinical Research Center of the Affiliated Hospital of Qingdao University. Randomization was conducted by the
investigators in accordance with a randomization schedule, created using the SAS 9.4 Proc Plan process by the statistical analysis unit for fasting and fed conditions, respectively.

Sitagliptin Phosphate/metformin Hydrochloride Tablets [50mg/850mg, batch no. M047893, manufactured by MSD Pharma (Singapore) Pte.Ltd] as reference formulations and Sitagliptin Phosphate/metformin Hydrochloride Tablets (50mg/850mg, batch no. 161006, manufactured by Tonghua Dongbao Pharmaceutical Co., Ltd.) as test formulations were used in this study. All study drugs were provided by the sponsor (Tonghua Dongbao Pharmaceutical Co., Ltd.) at no cost. All subjects were hospitalized in the phase I clinical research center on the day before dosing and placed on a uniform diet during hospitalization. Subjects in the fasting group (24 subjects) were asked to fast overnight (10 h) before administration, while the subjects in the fed group (24 subjects) needed to take an additional high-fat, high-calorie standard meal 30 min prior to the administration. Test and reference formulations of Sitagliptin Phosphate/metformin Hydrochloride Tablets was swallowed with 240 ml water at room temperature. Subjects were allocated to one of two groups randomly and equally with a 7-day washout interval between the two periods (Fig. 1).

Caffeine-containing beverages, food rich in xanthine, fruits that affect drug metabolism (e.g., grapefruit, dragon fruit, mango) and alcohol were prohibited from 48 h prior to dosing to the completion of blood sampling.

Blood Sampling

Blood samples (4 ml) were collected in vacuum tubes containing EDTA-K$_2$ at pre-dosing (0 h) and 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4, 5, 6, 8,10,12, 16, 24, 32, 38 and 72 h after dosing in each study period. The samples were centrifuged at 3000 rpm for 10 min at 2–8°C to separate the plasma. Samples were divided into two aliquots and stored at -80°C until analysis.

Pharmacokinetic Methods

Plasma samples were determined at Junke Zhengyuan (Beijing) Pharmaceutical Research Co., Ltd., and analyzed by LC MS/MS methods, which were validated in terms of selectivity, accuracy, precision, recovery and stability. The LC-MS/MS system consisted of a Shimadzu UFLC 20-AD ultrafast liquid phase system (Shimadzu Corp., Kyoto, Japan) and API 4000 mass spectrometer (Applied Biosystems, MDS Sciex). Metformin: mobile phase A consisted of 0.1% FA (by volume) containing 5mMammonium acetate and mobile phase B consisted of 0.1% FA (by volume) in ACN. Sitagliptin: mobile phase A consisted of 0.1% FA (by volume) in water and mobile phase B consisted of 0.1% FA (by volume) in ACN. API 4000 was operated in the positive ion multiple reaction monitoring (MRM) mode using Turbo Spray. The lower limit of quantification (LLQ) for metformin the plasma assay was 3 ng/mL and the linear calibration range was 3–1500 ng/mL. The overall precision of the metformin assay was 8.9% coefficient of variation (CV). The lower limit of quantification (LLQ) for sitagliptin the plasma assay was 1 ng/mL and the linear calibration range was 1–500 ng/mL. The overall precision of the sitagliptin assay was 5.8% coefficient of variation (CV).
Safety and Tolerability Assessments

Data from all study participants were included in safety and tolerability assessments. Evaluation of safety was accomplished through subject-reported adverse events, investigator observations and assessments, and prespecified study evaluations (laboratory safety tests, ECGs and vital sign measurements). Safety and tolerability were evaluated by clinical review of all safety parameters.

Statistical Analysis

Analysis of variance (ANOVA) was performed on the logarithmically transformed values of the primary PK parameters ($C_{\text{max}}$, $AUC_{0-t}$, and $AUC_{0-\infty}$). The ratios of geometric means (GM) of these primary PK parameters (test/reference) and their 90% confidence intervals (CIs) were calculated. The two preparations were considered bioequivalent if the 90% CIs of the ratios of GM of the primary PK parameters were within the predefined acceptance range of 80–125%. The independent samples t-test was used for comparisons of logarithmically transformed primary PK parameters of the test formulation. All PK parameter analysis was calculated by WinNonlin 7.0, while other data processing and statistical analyses were performed by SAS 9.4.

Results

Subject Disposition

The overall study population enrolled 48 subjects (fasting group 24, fed group 24). All of 24 subjects (14 males, 10 females) in the fasting group completed the study. The demographic details were as follows (mean ± SD): age was 28.9±8.28 years, height 166.17±7.299 cm, weight 61.54±7.699 kg and body mass index (BMI) 22.25±1.789 kg/m$^2$. A total of 24 healthy subjects (15 males and 9 females) were enrolled in the fed group. Twenty-three subjects completed the two treatment periods while one subject took the initiative to drop out during the baseline before the second treatment period. The demographic details were as follows (mean ± SD): age was 25.6±4.69 years, height 168.27±10.140 cm, weight 62.56±8.779 kg and body mass index (BMI) 22.03±1.850 kg/m2.

Pharmacokinetics

Fasting group

The plasma concentration-time profiles for sitagliptin and metformin under fasting conditions are shown respectively in Fig. 2 and Fig.3. Summaries of PK parameters for sitagliptin and metformin are presented in Table 1. ANOVA indicated a lack of period and sequence effects for $C_{\text{max}}$, $AUC_{0-t}$, and $AUC_{0-\infty}$. There was a statistically significant difference between formulations in $C_{\text{max}}$, $AUC_{0-t}$, and $AUC_{0-\infty}$ ($p \leq 0.05$). The 90% CIs for the geometric mean ratios of $C_{\text{max}}$, $AUC_{0-t}$, and $AUC_{0-\infty}$ and the power of the test are presented in Table 1, and all of them were within the predefined equivalence limit of 0.80-1.25.

Fed group
The mean plasma concentration-time profiles for sitagliptin and metformin under fed conditions are shown respectively in Fig. 4 and Fig. 5. Summaries of PK parameters for sitagliptin and metformin are presented in Table 2. ANOVA indicated a lack of period and sequence effects for $C_{\text{max}}$, $\text{AUC}_{0-t}$, and $\text{AUC}_{0-\infty}$. There was a statistically significant difference between formulations in $C_{\text{max}}$, $\text{AUC}_{0-t}$, and $\text{AUC}_{0-\infty}$ ($p \leq 0.05$). The 90% CIs for the geometric mean ratios of $C_{\text{max}}$, $\text{AUC}_{0-t}$, and $\text{AUC}_{0-\infty}$ and the power of the test are presented in Table 2, and all of them were within the predefined equivalence limit of 0.80-1.25.

Safety and Tolerability

Both test and reference formulations were generally well tolerated during the entire study periods. There were no protocol violations or serious adverse events (SAEs) observed in the study under either fasting or fed conditions. Four volunteers experienced a total of 4 AEs in fasting group and the fed group respectively. The AEs were listed in Table 3 and Table 4.

Discussion

Type 2 diabetes mellitus (T2DM) is a complex metabolic disease with an increasing number of patients each year. [12] Sitagliptin is a dipeptidyl peptidase-4 inhibitor (DPP-4), a newer treatment for type 2 diabetes mellitus. [13] Metformin hydrochloride is a biguanide, widely viewed as foundation therapy for type 2 diabetes mellitus. [14] More and more researches suggest that combination tablets will be an increasingly common strategy for the treatment of type 2 diabetes. [8] Sitagliptin Phosphate/metformin Hydrochloride Tablets is a single-tablet, fixed-dose combination of the dipeptidyl peptidase-4 inhibitor sitagliptin and the biguanide anti-hyperglycemic metformin which has become an important treatment for type 2 diabetes. [15] In this study, sitagliptin and metformin in plasma were quantitatively analyzed, and the pharmacokinetic characteristics and safety of domestic and original Sitagliptin Phosphate/metformin Hydrochloride Tablets were investigated, and the bioequivalence of the two preparations was evaluated. To provide multiple options for clinical combination regimens for type 2 diabetes.

Here, we assess the bioequivalence of Sitagliptin Phosphate/metformin Hydrochloride Tablets under fasting and fed conditions in healthy Chinese subjects following a single oral dose of 50mg/850mg test (Tonghua Dongbao Pharmaceutical Co., Ltd.) and reference (MSD Pharma (Singapore) Pte.Ltd) formulations. The two medicinal products are bioequivalent when their 90% CI of the $\text{AUC}_{0-t}$, $\text{AUC}_{0-\infty}$ and $C_{\text{max}}$ of the reference preparation over the test preparation fall between the predetermined limits of 80 ~ 125%.

According to our results, both formulations were well tolerated, and no SAEs was observed during the study. All reported AEs were of mild intensity, and no subjects withdrew from the study because of any AEs. The main adverse drug reactions were nausea, hyperuricemia, and hyperkalemia. Most of the adverse drug reactions in this trial are similar to those reported in the literature, indicating that the test and reference formulations have good safety and tolerability in Chinese healthy subjects. [16]
reference formulations specifications and previous literature have reported that food can decrease metformin absorption and slightly delay it absorption.[17] The main pharmacokinetic parameters of oral reference formulations metformin in fed group were significantly lower than those of in fasting group, $C_{\text{max}}$, $\text{AUC}_{0 - t}$ and $\text{AUC}_{0 - \infty}$ were significantly lower. Metformin is usually recommended in meals to improve gastrointestinal tolerance. At the same time, food does not affect the PK of sitagliptin. Therefore, Sitagliptin Phosphate/metformin Hydrochloride Tablets are recommended for dietary administration.

In this study, the parameters such as recoveries, matrix effects, linear range, lower limit of quantification, stability by specificity, precision, and accuracy specifications, were investigated to confirm the method of LC-MS/MS. Concentration of sitagliptin and metformin in human plasma showed good linear relationship within 1-500 ng/mL and 3-1500 ng/mL. The relative standard deviation (RSD) values of intra- and inter-day precision were both less than 10%. As an open-label study, AEs assessment may not be objective enough. When the test formulation passes the evaluation and enters the market, the efficacy and side effects need to be further explored. In addition, as this study is designed as a bioequivalence trial, The pharmacokinetic parameters and characteristics were all healthy adults. Further studies are needed to obtain pharmacokinetic parameters and make a recommendation about the medication with the Sitagliptin Phosphate/metformin Hydrochloride Tablets in special populations.

**Conclusion**

Our study evaluated the pharmacokinetics and bioequivalence of two Sitagliptin Phosphate/metformin Hydrochloride Tablets formulations via the pharmacokinetic parameters of sitagliptin and metformin. Both products showed good tolerability with a similar safety profile. The 90% CIs of the ratios of the GM of the test and reference formulations for $C_{\text{max}}$, $\text{AUC}_{0 - t}$ and $\text{AUC}_{0 - \infty}$ were all within the predefined bioequivalence criteria range of 80–125%, showing that the test formulation was bioequivalent to the reference formulation by any of detection indicators.
