

Supplemental Figure 5. C57BL/6 strain vs. Cre-Lox mouse construction ‘Controls’ 14-day overall survival following exposure to the sequential insults of experimental shock/ sepsis were not statistically distinct. Control or C57BL/6 mouse 14-day overall survival after subjecting them to the sequential insults of Hem/CLP as depicted by Kaplan-Meier curves. The n/treatment group is listed in parentheses; these groups were not significantly different as determined by a Log-Rank test.
