

Supplementary material: Strips that were not trimmed and processed in western blotting analysis.

For western blotting analyses, the secondary antibodies were incubated and coated with ECL luminescence solution on the strips, and data were collected directly on FluorChem FC3 gel imaging systems. The original strips of the strips used in each figure are as follows:

Fig.8A

Fig.10E

In all the blots graphs, the three lanes on the left are the model group, and the three lanes on the right are the specnuezhenide processing group.

Fig.10F

In all the blots graphs, the three lanes on the left are the model group, and the three lanes on the right are the specnuezhenide processing group.
