

Supplemental Figure S1. Tissues with no mRNA expression following intraperitoneal administration of AAV6.2FF-TLR9. 6-week-old female BALB/c mice were injected with either PBS or 1×10^{11} vg of AAV6.2FF-TLR9 and tissues were collected 21 days post-injection. FFPE tissues were incubated with an anti-human TLR9 probe, and the signal was amplified then detected using Fast Red. Nuclei were counterstained with hematoxylin. Scale bars=50um.
