

Additional file 1. Full-length original unprocessed immunoblot images corresponding to Figure 4.

This file contains the full-length original unprocessed immunoblot images corresponding to Figure 4A and the quantification shown in Figure 4B. The outer boundaries of the available membrane or film images are visible. Red boxes indicate the cropped regions used for the representative images shown in Figure 4A. Lanes outside the red boxes were not used for the representative Figure 4A panel. Independent replicates used for quantification are also shown.

Full-length original unprocessed blots for additional independent replicates used for Figure 4B quantification

Upper blot: p-ERK

Lower blot: total ERK

HepaRG lanes under Replicate 2 and Replicate 3 were used for Figure 4B quantification.

Myoblast and HepG2 lanes were unrelated samples and were not used for Figure 4.
