

Additional Figure 2: Bout length during NREM and REM: A) Shows the NREM bout length for the infection and the control group during the Light and Dark period. No significant difference was found during the Light period ($p = 0.97$) and Dark period ($p = 0.27$). B) REM bout length for the infection and control group during the Light and Dark period. No difference was found during either period ($p = 0.97$ for both periods). $n_{\text{infection}} = 10$, $n_{\text{control}} = 8$
